AquaSnap® 30RAP010-150 Air-Cooled Chillers and 30RAP011-060 Air-Cooled Chillers with Greenspeed® Intelligence with Puron® Refrigerant (R-410A) 50/60 Hz

Controls, Start-Up, Operation, Service, and Troubleshooting

CONTENTS

SAFETY CONSIDERATIONS

Installing, starting up, and servicing this equipment can be hazardous due to system pressures, electrical components, and equipment location (roof, elevated structures, mechanical rooms, etc.). Only trained, qualified installers and service mechanics should install, start up, and service this equipment.

When working on this equipment, observe precautions in the literature, and on tags, stickers, and labels attached to the equipment, and any other safety precautions that apply. Follow all safety codes. Wear safety glasses and work gloves. Use care in handling, rigging, and setting this equipment, and in handling all electrical components.

⚠ **WARNING**

Electrical shock can cause personal injury and death. Shut off all power to this equipment during installation. There may be more than one disconnect switch. Tag all disconnect locations to alert others not to restore power until work is completed.

⚠ WARNING

DO NOT VENT refrigerant relief valves within a building. Outlet from relief valves must be vented outdoors in accordance with the latest edition of ANSI/ASHRAE (American National Standards Institute/American Society of Heating, Refrigeration and Air-Conditioning Engineers) 15 (Safety Code for Mechanical Refrigeration). The accumulation of refrigerant in an enclosed space can displace oxygen and cause asphyxiation. Provide adequate ventilation in enclosed or low overhead areas. Inhalation of high concentrations of vapor is harmful and may cause heart irregularities, unconsciousness, or death. Misuse can be fatal. Vapor is heavier than air and reduces the amount of oxygen available for breathing. Product causes eye and skin irritation. Decomposition products are hazardous.

⚠ WARNING

DO NOT USE TORCH to remove any component. System contains oil and refrigerant under pressure.

To remove a component, wear protective gloves and goggles and proceed as follows:

a. Shut off electrical power to unit.

b. Recover refrigerant to relieve all pressure from system using both high-pressure and low pressure ports.

c. Traces of vapor should be displaced with nitrogen and the work area should be well ventilated. Refrigerant in contact with an open flame produces toxic gases.

d. Cut component connection tubing with tubing cutter and remove component from unit. Use a pan to catch any oil that may come out of the lines and as a gage for how much oil to add to the system.

e. Carefully unsweat remaining tubing stubs when necessary. Oil can ignite when exposed to torch flame.

Failure to follow these procedures may result in personal injury or death.

⚠ CAUTION

DO NOT re-use compressor oil or any oil that has been exposed to the atmosphere. Dispose of oil per local codes and regulations. DO NOT leave refrigerant system open to air any longer than the actual time required to service the equipment. Seal circuits being serviced and charge with dry nitrogen to prevent oil contamination when timely repairs cannot be completed. Failure to follow these procedures may result in damage to equipment.

⚠ CAUTION

Compressors and optional hydronic system pumps require specific rotation. For non-HEVCF (high-efficiency variable condenser fan) units, test condenser fan(s) first to ensure proper phasing. Swap any two incoming power leads to correct condenser fan rotation before starting any other motors. For HEVCF units, check to ensure the supply power phase rotation is clockwise A-B-C (L1-L2-L3).

⚠ CAUTION

Refrigerant charge must be removed slowly to prevent loss of compressor oil that could result in compressor failure.

⚠ CAUTION

This unit uses a microprocessor control system. Do not short or jumper between terminations on circuit boards or modules; control or board failure may result.

Be aware of electrostatic discharge (static electricity) when handling or making contact with circuit boards or module connections. Always touch a chassis (grounded) part to dissipate body electrostatic charge before working inside control center.

Use extreme care when handling tools near boards and when connecting or disconnecting terminal plugs. Circuit boards can easily be damaged. Always hold boards by the edges and avoid touching components and connections.

This equipment uses, and can radiate, radio frequency energy. If not installed and used in accordance with the instruction manual, it may cause interference to radio communications. It has been tested and found to comply with the limits for a Class A computing device pursuant to International Standard in North America EN61000-2/3 which are designed to provide reasonable protection against such interference when operated in a commercial environment. Operation of this equipment in a residential area is likely to cause interference, in which case the user, at his own expense, will be required to take whatever measures may be required to correct the interference.

Always store and transport replacement or defective boards in anti-static shipping bag.

⚠ CAUTION

To prevent potential damage to heat exchanger, always run fluid through heat exchanger when adding or removing refrigerant charge. Use appropriate brine solutions in cooler fluid loop to prevent the freezing of brazed plate heat exchanger, optional hydronic section, and/or interconnecting piping when the equipment is exposed to temperatures below 32°F (0°C). Proof of flow switch and strainer are factory installed on all models. Do NOT remove power from this chiller during winter shutdown periods without taking precaution to remove all water from heat exchanger and optional hydronic system. Failure to properly protect the system from freezing may constitute abuse and may void warranty.

⚠ CAUTION

Puron® refrigerant (R-410A) systems operate at higher pressures than standard R-22 systems. Do not use R-22 service equipment or components on Puron refrigerant equipment. If service equipment is not rated for Puron refrigerant, equipment damage or personal injury may result.

GENERAL

This publication contains Controls, Start-Up, Operation, Service, and Troubleshooting information for the AquaSnap® 30RAP air-cooled chillers. See Table 1. These chillers are equipped with *Comfort*Link controls and electronic expansion valves (EXVs).

Conventions Used in This Manual

The following conventions for discussing configuration points for the local display (scrolling marquee or Navigator™ accessory) will be used in this manual.

Point names will be written with the mode name first, then any sub-modes, then the point name, each separated by an arrow symbol (→). Names will also be shown in bold and italics. As an example, the Lead/Lag Circuit Select Point, which is located in the

Configuration mode, Option sub-mode, would be written as **Configuration →OPT2→LLCS**.

This path name will show the user how to navigate through the local display to reach the desired configuration. The user would scroll through the modes and sub-modes using the ▲ and ▼ keys. The arrow symbol in the path name represents pressing ENTER to move into the next level of the menu structure.

When a value is included as part of the path name, it will be shown at the end of the path name after an equals sign. If the value represents a configuration setting, an explanation will be shown in parentheses after the value. As an example, **Configuration→OPT2→LLCS = 1** (Automatic).

Pressing the ESCAPE and ENTER keys simultaneously will scroll an expanded text description of the point name or value across the display. The expanded description is shown in the local display tables but will not be shown with the path names in text.

The CCN (Carrier Comfort Network®) point names are also referenced in the local display tables for users configuring the unit with CCN software instead of the local display. The CCN tables are located in Appendix B of the manual.

30RAP150	140

Basic Controls Usage

SCROLLING MARQUEE DISPLAY

The scrolling marquee display is the standard interface display to the *Comfort*Link Control System for 30RAP units. The display has up and down arrow keys, an ENTER key, and an ESCAPE key. These keys are used to navigate through the different levels of the display structure. Press the ESCAPE key until the highest operating level is displayed to move through the top 11 mode levels indicated by LEDs (light-emitting diodes) on the left side of the display. See Fig. 1 and Table 2.
Fig. 1 — Scrolling Marquee Display

Once within a mode or sub-mode, pressing the ENTER and ESCAPE keys simultaneously will put the scrolling marquee display into expanded text mode where the full meaning of all sub-modes and items and their values can be displayed for the current selection. Press the ENTER and ESCAPE keys to return the scrolling marquee display to its default menu of rotating display items (those items in **Run Status→VIEW**). In addition, the password will be disabled, requiring that it be entered again before changes can be made to password protected items. Press the ESCAPE key to exit out of the expanded text mode.

NOTE: When the Language Selection (**Configuration→DISP→LANG**), variable is changed, all appropriate display expansions will immediately change to the new language. No power-off or control reset is required when reconfiguring languages.

When a specific item is located, the item name alternates with the value. Press the ENTER key at a changeable item and the value will be displayed. Press ENTER again and the value will begin to flash indicating that the value can be changed. Use the up and down arrow keys to change the value, and confirm the value by pressing the ENTER key.

Changing item values or testing outputs is accomplished in the same manner. Locate and display the desired item. Press ENTER so that the item value flashes. Use the arrow keys to change the value or state and press the ENTER key to accept it. Press the ESCAPE key to return to the next higher level of structure. Repeat the process as required for other items.

Items in the Configuration and Service Test modes are password protected. The words "PASS" and "WORD" will alternate on the display when required. The default password is 1111. Press ENTER and the 1111 password will be displayed. Press ENTER again and the first digit will begin to flash. Use the arrow keys to change the number and press ENTER to accept the digit. Continue with the remaining digits of the password. The password can only be changed through CCN operator interface software such as ComfortWORKS™, ComfortVIEW™, and Service Tool.

Configuration value cannot be changed while the unit is enabled. Remote Control-Off-Enable must be in the Off position in order to change any configuration mode.

See Table 2 and Appendix A for further details. See Table 3 for a description of operating modes.

Ckt — Circuit

*Throughout this text, the location of items in the menu structure will be described in the following format:

Item Expansion (Mode Name→Sub-mode Name→ITEM)

For example, using the language selection item:

Language Selection (***Configuration***→***DISP***→***LANG***)

NOTE: If the unit has a single circuit, the Circuit B items will not appear in the display, except the ability to configure circuit B will be displayed.

Table 3 — Operating Modes

MODE NO.	ITEM EXPANSION	DESCRIPTION
01	CSM CONTROLLING CHILLER	Chillervisor System Manager (CSM) is controlling the chiller.
02	WSM CONTROLLING CHILLER	Water System Manager (WSM) is controlling the chiller.
03	MASTER/SLAVE CONTROL	Dual Chiller control is enabled.
05	RAMP LOAD LIMITED	Ramp load (pull-down) limiting in effect. In this mode, the rate at which leaving fluid temperature is dropped is limited to a predetermined value to prevent compressor overloading. See Cooling Ramp Loading (**Configuration→SLCT→CRMP**). The pull-down limit can be modified, if desired, to any rate from 0.2° F to 2° F (0.1° to 1° C)/minute.
06	TIMED OVERRIDE IN EFFECT	Timed override is in effect. This is a 1 to 4 hour temporary override of the programmed schedule, forcing unit to Occupied mode. Override can be implemented with unit under Local (Enable) or CCN (Carrier Comfort Network®) control. Override expires after each use.
07	LOW COOLER SUCTION TEMPA	Circuit A cooler Freeze Protection mode. At least one compressor must be on, and the Saturated Suction Temperature is not increasing greater than 1.1° F (0.6° C) in 10 seconds. If the saturated suction temperature is less than the Brine Freeze Point (**Set Points→FRZ →BR.FZ**) minus 6° F (3.4° C) and less than the leaving fluid temperature minus 14° F (7.8° C) for 2 minutes, a stage of capacity will be removed from the circuit. Or, If the saturated suction temperature is less than the Brine Freeze Point minus 14° F (7.8° C), for 90 seconds, a stage of capacity will be removed from the circuit. The control will continue to decrease capacity as long as either condition exists.
08	LOW COOLER SUCTION TEMPB	Circuit B cooler Freeze Protection mode. At least one compressor must be on, and the Saturated Suction Temperature is not increasing greater than 1.1° F (0.6° C) in 10 seconds. If the saturated suction temperature is less than the Brine Freeze Point (**Set Points→FRZ →BR.FZ**) minus 6° F (3.4° C) and less than the leaving fluid temperature minus 14° F (7.8° C) for 2 minutes, a stage of capacity will be removed from the circuit. If the saturated suction temperature is less than the Brine Freeze Point minus 14° F (7.8° C) for 90 seconds, a stage of capacity will be removed from the circuit. The control will continue to decrease capacity as long as either condition exists.
09	SLOW CHANGE OVERRIDE	Slow change override is in effect. The leaving fluid temperature is close to and moving towards the control point.
10	MINIMUM OFF TIME ACTIVE	Chiller is being held off by Minutes Off Time (**Configuration→OPT2→DELY**).
13	DUAL SETPOINT	Dual Set Point mode is in effect. Chiller controls to Cooling Set Point 1 (**Set Points→COOL →CSP.1**) during occupied periods and Cooling Set Point 2 (**Set Points →COOL→CSP.2**) during unoccupied periods.
14	TEMPERATURE RESET	Temperature reset is in effect. In this mode, chiller is using temperature reset to adjust leaving fluid set point upward and is currently controlling to the modified set point. The set point can be modified based on return fluid, outdoor-air-temperature, space temperature, or 4 to 20 mA signal.
15	DEMAND/SOUND LIMITED	Demand limit is in effect. This indicates that the capacity of the chiller is being limited by demand limit control option. Because of this limitation, the chiller may not be able to produce the desired leaving fluid temperature. Demand limit can be controlled by switch inputs or a 4 to 20 mA signal.
16	COOLER FREEZE PROTECTION	Cooler fluid temperatures are approaching the Freeze point (see Alarms and Alerts section for definition). The chiller will be shut down when either fluid temperature falls below the Freeze point.
17	LOW TEMPERATURE COOLING	Chiller is in Cooling mode and the rate of change of the leaving fluid is negative and decreasing faster than -0.5° F per minute. Error between leaving fluid and control point exceeds fixed amount. Control will automatically unload the chiller if necessary.
18	HIGH TEMPERATURE COOLING	Chiller is in Cooling mode and the rate of change of the leaving fluid is positive and increasing. Error between leaving fluid and control point exceeds fixed amount. Control will automatically load the chiller if necessary to better match the increasing load.
19	MAKING ICE	Chiller is in an unoccupied mode and is using Cooling Set Point 3 (**Set Points →COOL →CSP.3**) to make ice. The ice done input to the Energy Management Module (EMM) is open.
20	STORING ICE	Chiller is in an unoccupied mode and is controlling to Cooling Set Point 2 (**Set Points →COOL →CSP.2**). The ice done input to the Energy Management Module (EMM) is closed.
21	HIGH SCT CIRCUIT A	Chiller is in a Cooling mode and the Saturated Condensing Temperature (SCT) is greater than the calculated maximum limit. No additional stages of capacity will be added. Chiller capacity may be reduced if SCT continues to rise to avoid high-pressure switch trips by reducing condensing temperature.
22	HIGH SCT CIRCUIT B	Chiller is in a Cooling mode and the Saturated Condensing Temperature (SCT) is greater than the calculated maximum limit. No additional stages of capacity will be added. Chiller capacity may be reduced if SCT continues to rise to avoid high-pressure switch trips by reducing condensing temperature.
23	MINIMUM COMP ON TIME	Cooling load may be satisfied, however control continues to operate compressor to ensure proper oil return. May be an indication of oversized application, low fluid flow rate or low loop volume.
24	PUMP OFF DELAY TIME	Cooling load is satisfied, however cooler pump continues to run for the number of minutes set by the configuration variable Cooler Pump Shutdown Delay (**Configuration→OPT1 →PM.DY**).
25	LOW SOUND MODE	Chiller operates at higher condensing temperature and/or reduced capacity to minimize overall unit noise during evening/night hours (**Configuration→OPT2→LS.MD**).
AO	CIRCUIT A TRIO OIL MGMT	Additional stage of capacity is added if circuit operates with only one compressor for an accumulated time of 60 minutes.
BO	CIRCUIT B TRIO OIL MGMT	
OL	OAT LOCKOUT IN EFFECT	Chiller will not start due to OAT less than OAT lockout temperature set point (**Set Points→COOL→OAT.L**).

ACCESSORY NAVIGATOR™ DISPLAY MODULE

The Navigator module provides a mobile user interface to the *Comfort*Link control system, which is only available as a field-installed accessory. The display has up and down arrow keys, an ENTER key, and an ESCAPE key. These keys are used to navigate through the different levels of the display structure. Press the ESCAPE key until "Select a Menu Item" is displayed to move through the top 11 mode levels indicated by LEDs on the left side of the display. See Fig. 2.

Once within a Mode or sub-mode, a ">" indicates the currently selected item on the display screen. Pressing the ENTER and ESCAPE keys simultaneously will put the Navigator module into expanded text mode where the full meaning of all sub-modes and items and their values can be displayed. Pressing the ENTER and ESCAPE keys when the display says "Select Menu Item" (Mode LED level) will return the Navigator module to its default menu of rotating display items (those items in *Run Status→VIEW*). In addition, the password will be disabled, requiring that it be entered again before changes can be made to password protected items. Press the ESCAPE key to exit out of the expanded text mode.

NOTE: When the Language Selection (*Configuration→DISP→LANG*) variable is changed, all appropriate display expansions will immediately change to the new language. No power-off or control reset is required when reconfiguring languages.

When a specific item is located, the item name appears on the left of the display, the value will appear near the middle of the display, and the units (if any) will appear on the far right of the display. Press the ENTER key at a changeable item and the value will begin to flash. Use the up and down arrow keys to change the value, and confirm the value by pressing the ENTER key.

Changing item values or testing outputs is accomplished in the same manner. Locate and display the desired item. Press ENTER so that the item value flashes. Use the arrow keys to change the value or state and press the ENTER key to accept it. Press the ESCAPE key to return to the next higher level of structure. Repeat the process as required for other items.

Items in the Configuration and Service Test modes are password protected. The words **Enter Password** will be displayed when required, with 1111 also being displayed. The default password is 1111. Use the arrow keys to change the number and press ENTER to enter the digit. Continue with the remaining digits of the password. The password can only be changed through CCN operator interface software such as ComfortWORKS, Comfort-VIEW, and Service Tool.

Adjusting the Contrast

The contrast of the display can be adjusted to suit ambient conditions. To adjust the contrast of the Navigator module, press the ESCAPE key until the display reads, "Select a menu item." Using the arrow keys move to the Configuration mode. Press ENTER to obtain access to this mode. The display will read:

> TEST   OFF
   METR   OFF
   LANG   ENGLISH

Pressing ENTER will cause the "OFF" to flash. Use the up or down arrow to change "OFF" to "ON". Pressing ENTER will illuminate all LEDs and display all pixels in the view screen. Pressing ENTER and ESCAPE simultaneously allows the user to adjust the display contrast. Use the up or down arrows to adjust the contrast. The screen's contrast will change with the adjustment. Press ENTER to accept the change. The Navigator module will keep this setting as long as it is plugged in to the LEN (local equipment network) bus.

Adjusting the Backlight Brightness

The backlight of the display can be adjusted to suit ambient conditions. The factory default is set to the highest level. To adjust the backlight of the Navigator module, press the ESCAPE key until the display reads, "Select a menu item". Using the arrow keys move to the Configuration mode. Press ENTER to obtain access to this mode. The display will read:

> TEST   OFF
   METR   OFF
   LANG   ENGLISH

Pressing ENTER will cause the "OFF" to flash. Use the up or down arrow keys to change "OFF" to "ON". Pressing ENTER will illuminate all LEDs and display all pixels in the view screen. Pressing the up and down arrow keys simultaneously allows the user to adjust the display brightness. Use the up or down arrow keys to adjust screen brightness. Press ENTER to accept the change. The Navigator module will keep this setting as long as it is plugged in to the LEN bus.

Fig. 2 — Accessory Navigator™ Display Module

CONTROLS

General

The 30RAP air-cooled scroll chillers contain the *Comfort*Link electronic control system that controls and monitors all operations of the chiller.

The control system is composed of several components as listed in sections starting on page 26. See Fig. 3-5 for typical control box drawings. See Fig. 6-19 for wiring. Table 4 lists the drawings by unit size.

Main Base Board (MBB)

See Fig. 20. The MBB is the heart of the *Comfort*Link control system. It contains the major portion of operating software and controls the operation of the machine. The MBB continuously monitors input/output channel information received from its inputs and from all other modules. The MBB receives inputs from the discharge and suction pressure transducers and thermistors. See Table 5. The MBB also receives the feedback inputs from each compressor current sensor board and other status switches. See Tables 6 and 7. The MBB also controls several outputs. Relay outputs controlled by the MBB are shown in Tables 8 and 9. Information is transmitted between modules via a 3-wire communication bus or LEN (Local Equipment Network). The CCN (Carrier Comfort Network) bus is also supported. Connections to both LEN and CCN buses are made at the LVT (low voltage terminal). See Fig. 20 and 21.
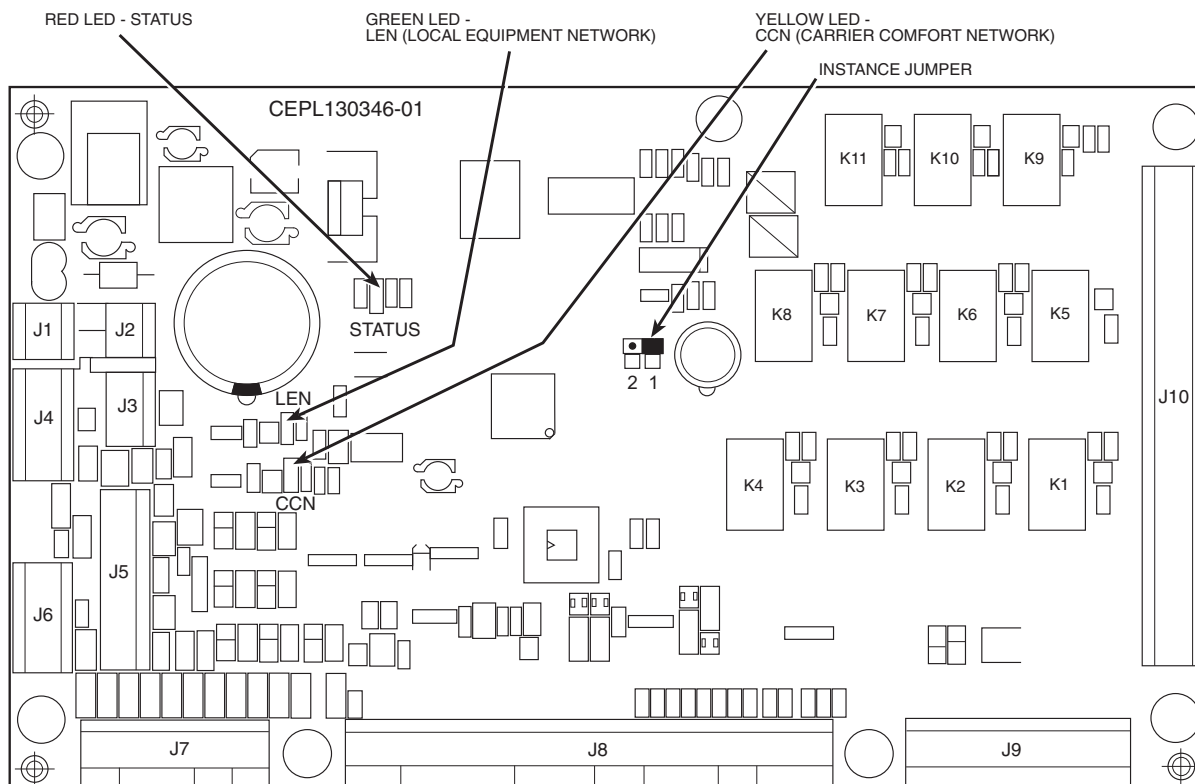

Fig. 20 — Main Base Board
Fig. 21 — CCN Wiring Diagram

Energy Management Module (EMM)

EMM is available as a factory-installed option or as a field-installed accessory. The EMM module receives 4 to 20 mA inputs for the leaving fluid temperature reset, cooling set point and demand limit functions. The EMM module also receives the switch inputs for the field-installed 2-stage demand limit and ice done functions. The EMM module communicates the status of all inputs with the MBB, and the MBB adjusts the control point, capacity limit, and other functions according to the inputs received.

Current Sensor Board (CSB)

The CSB is used to monitor the status of the compressors by measuring current and providing an analog input to the main base board (MBB) or compressor expansion module (CXB).

Auxiliary (AUX) Board

The AUX board is used with the digital scroll option and the low ambient head pressure option. It provides additional inputs and outputs for digital scroll control along with analog outputs to control head pressure control fan speeds. See Tables 10 and 11.

Electronic Expansion Valve (EXV) Board

The EXV board communicates with the MBB and directly controls the expansion valves to maintain the correct compressor superheat.

Compressor Expansion Board (CXB)

The CXB communicates with the MBB and directly controls additional compressors for contactors, cooler/pump heaters, and compressor crankcase heater relays for sizes 070-150.

Enable/Off/Remote Control Switch

The Enable/Off/Remote Control switch (SW1) is a 3-position switch used to control the chiller. When switched to the Enable position the chiller is under its own control. Move the switch to the Off position to shut the chiller down. Move the switch to the Remote Control position and a field-installed dry contact can be used to start the chiller. The contacts must be capable of handling a 24 vac, 50-mA load. In the Enable and Remote Control (dry contacts closed) positions, the chiller is allowed to operate and respond to the scheduling configuration, CCN configuration, and set point data. See Fig. 22.

Emergency On/Off Switch

The Emergency On/Off switch (SW2) should only be used when it is required to shut the chiller off immediately. Power to the MBB, EMM, and marquee display is interrupted when this switch is off and all outputs from these modules will be turned off. The cooler and pump heaters are energized.
Fig. 22 — Enable/Off/Remote Control Switch, and Emergency On/Off Switch Locations

Board Addresses

The main base board (MBB) has a 3-position instance jumper that must be set to "1." The electronic expansion valve (EXV) board, compressor expansion board (CXB), and energy management module (EMM) board have 4-position DIP switches. All switches are set to "On" for these boards. The auxiliary board (AUX) has an 8-position DIP switch. Switches 2, 5, and 7 are set to "On."

Control Module Communication

RED LED

Proper operation of the control boards can be visually checked by looking at the red status LEDs. During initial power-up the LED will signal a 1/2-second blink 3 times, followed by a pause. This indicates that the processor is booting. If this pattern repeats, it is an indication that the control board is in a continuous reboot loop and the board should be replaced. When operating correctly, the red status LEDs should be blinking in unison at a rate of once every 2 seconds. If the red LEDs are not blinking in unison, verify that correct power is being supplied to all modules. Be sure that the main control is supplied with the current software. If necessary, reload current software. If the problem still persists, replace the control board. A red LED that is lit continuously or blinking at a rate of once per second or faster indicates that the control board should be replaced.

27

GREEN LED

The MBB has one green LED. The Local Equipment Network (LEN) LED should always be blinking whenever power is on. All other boards have a LEN LED which should be blinking whenever power is on. Check LEN connections for potential communication errors at the board J3 and/or J4 connectors. Communication between modules is accomplished by a 3-wire sensor bus. These 3 wires run in parallel from module to module. The J4 connector on the MBB provides both power and communication directly to the scrolling marquee display only.

YELLOW LED

The MBB has one yellow LED. The Carrier Comfort Network (CCN) LED will blink during times of network communication.

Carrier Comfort Network® (CCN) Interface

The 30RAP chiller units can be connected to the CCN if desired. The communication bus wiring is a shielded, 3-conductor cable with drain wire and is supplied and installed in the field. See Table 12. The system elements are connected to the communication bus in a daisy chain arrangement. The positive pin of each system element communication connector must be wired to the positive pins of the system elements on either side of it. This is also required for the negative and signal ground pins of each system element. Wiring connections for CCN should be made at LVT. Consult the CCN Contractor's Manual for further information. Refer to Fig. 21.

NOTE: Conductors and drain wire must be 20 AWG (American Wire Gage) minimum stranded, tinned copper. Individual conductors must be insulated with PVC, PVC/nylon, vinyl, Teflon[1], or polyethylene. An aluminum/polyester 100% foil shield and an outer jacket of PVC, PVC/nylon, chrome vinyl, or Teflon with a minimum operating temperature range of –20°C to 60°C is required. Wire manufactured by Alpha (2413 or 5463), American (A22503), Belden (8772), or Columbia (02525) meets the above mentioned requirements.

It is important when connecting to a CCN communication bus that a color coding scheme be used for the entire network to simplify the installation. It is recommended that red be used for the signal positive, black for the signal negative, and white for the signal ground. Use a similar scheme for cables containing different colored wires.

At each system element, the shields of its communication bus cables must be tied together. If the communication bus is entirely within one building, the resulting continuous shield must be connected to a ground at one point only. If the communication bus cable exits from one building and enters another, the shields must be connected to grounds at the lightning suppressor in each building

---

1. Teflon is a registered trademark of Dupont.

where the cable enters or exits the building (one point per building only). To connect the unit to the network:

1. Turn off power to the control box.
2. Cut the CCN wire and strip the ends of the red (+), white (ground), and black (–) conductors. (Substitute appropriate colors for different colored cables.)
3. Connect the red wire to (+) terminal on LVT of the plug, the white wire to COM terminal, and the black wire to the (–) terminal.
4. The RJ14 CCN connector on LVT can also be used, but is only intended for temporary connection (for example, a laptop computer running Service Tool).

> IMPORTANT: A shorted CCN bus cable will prevent some routines from running and may prevent the unit from starting. If abnormal conditions occur, unplug the connector. If conditions return to normal, check the CCN connector and cable. Run new cable if necessary. A short in one section of the bus can cause problems with all system elements on the bus.

Alarm Control

ALARM ROUTING CONTROL

Alarms recorded on the chiller can be routed through the CCN. To configure this option, the *Comfort*Link control must be configured to determine which CCN elements will receive and process alarms. Input for the decision consists of eight digits, each of which can be set to either 0 or 1. Setting a digit to 1 specifies that alarms will be sent to the system element that corresponds to that digit. Setting all digits to 0 disables alarm processing. The factory default is 00000000. See Fig. 23. The default setting is based on the assumption that the unit will not be connected to a network. If the network does not contain a ComfortVIEW, Comfort-WORKS™, TeLink, DataLINK™, or BAClink module, enabling this feature will only add unnecessary activity to the CCN communication bus.

This option can be modified with Network Service Tool. It cannot be modified with the scrolling marquee display.

Typical configuration of the Alarm Routing variable is 11010000. This Alarm Routing status will transmit alarms to ComfortVIEW software, TeLink, BAClink, and DataLINK.

ALARM EQUIPMENT PRIORITY

The ComfortVIEW software uses the equipment priority value when sorting alarms by level. The purpose of the equipment priority value is to determine the order in which to sort alarms that have the same level. A priority of 0 is the highest and would appear first when sorted. A priority of 7 would appear last when sorted. For example, if two chillers send out identical alarms, the chiller with the higher priority would be listed first. The default is 4. This variable can only be changed when using ComfortVIEW software or Network Service Tool. This variable cannot be changed with the scrolling marquee display.

COMMUNICATION FAILURE RETRY TIME

This variable specifies the amount of time that will be allowed to elapse between alarm retries. Retries occur when an alarm is not acknowledged by a network alarm acknowledger, which may be either a ComfortVIEW software or TeLink. If acknowledgment is not received, the alarm will be re-transmitted after the number of minutes specified in this decision. This variable can only be changed with ComfortVIEW software or Network Service Tool. This variable cannot be changed with the scrolling marquee display.

RE-ALARM TIME

This variable specifies the amount of time that will be allowed to elapse between re-alarms. A re-alarm occurs when the conditions that caused the initial alarm continue to persist for the number of minutes specified in this decision. Re-alarming will continue to occur at the specified interval until the condition causing the alarm is corrected. This variable can only be changed with Comfort-VIEW software or Network Service Tool. This variable cannot be changed with the scrolling marquee display.

ALARM SYSTEM NAME

This variable specifies the system element name that will appear in the alarms generated by the unit control. The name can be up to 8 alphanumeric characters in length. This variable can only be changed with ComfortVIEW software or Network Service Tool. This variable cannot be changed with the scrolling marquee display.

Sensors

The electronic control uses 4 to 7 thermistors to sense temperatures for controlling chiller operation. See Table 5. These sensors are outlined below. Thermistors RGTA, RGTB, EWT, LWT, and OAT are 5 kΩ at 77°F (25°C) thermistors and are identical in temperature versus resistance and voltage drop performance. The dual chiller thermistor is 5 kΩ at 77°F (25°C) thermistor. Space temperature thermistor is a 10 kΩ at 77°F (25°C). The DTT thermistor is an 86 kΩ at 77°F (25°C) thermistor. See Thermistors section for temperature-resistance-voltage drop characteristics.

BAClink or DataLINK™									
Unused									
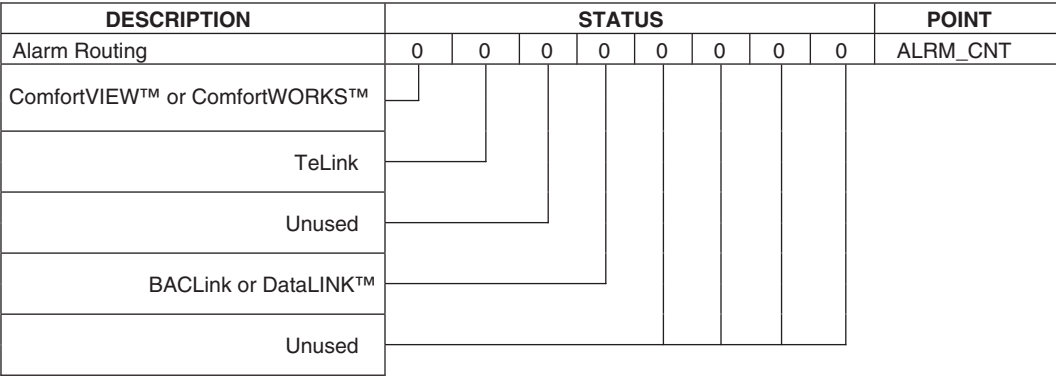

Fig. 23 — Alarm Routing Control

COOLER LEAVING FLUID SENSOR

The thermistor is installed in a well in the factory-installed leaving fluid piping coming from the bottom of the brazed-plate heat exchanger.

COOLER ENTERING FLUID SENSOR

The thermistor is installed in a well in the factory-installed entering fluid piping coming from the top of the brazed-plate heat exchanger.

COMPRESSOR RETURN GAS TEMPERATURE SENSOR

These thermistors are installed in a well located in the suction line of each circuit.

OUTDOOR-AIR TEMPERATURE SENSOR (OAT)

This sensor is factory installed on a bracket which is inserted through the base pan of the unit.

DISCHARGE TEMPERATURE THERMISTOR (DTT)

This sensor is only used on units with the digital compressor option. The sensor is mounted on the discharge line close to the discharge of the digital compressor. It attaches to the discharge line using a spring clip and protects the system from high discharge gas temperature when the digital compressor is used. This sensor is connected to the AUX board.

REMOTE SPACE TEMPERATURE SENSOR OR DUAL LEAVING WATER TEMPERATURE SENSOR

One of two inputs can be connected to the LVT. See appropriate sensor below.

Remote Space Temperature Sensor

Sensor (part no. 33ZCT55SPT) is an accessory sensor that is remotely mounted in the controlled space and used for space temperature reset. The sensor should be installed as a wall-mounted thermostat would be (in the conditioned space where it will not be subjected to either a cooling or heating source or direct exposure to sunlight, and 4 to 5 ft above the floor).

Space temperature sensor wires are to be connected to terminals in the unit main control box. The space temperature sensor includes a terminal block (SEN) and a RJ11 female connector. The RJ11 connector is used access into the Carrier Comfort Network® (CCN) at the sensor.

To connect the space temperature sensor (Fig. 24):

1. Using a 20 AWG twisted pair conductor cable rated for the application, connect 1 wire of the twisted pair to one SEN terminal and connect the other wire to the other SEN terminal located under the cover of the space temperature sensor.
2. Connect the other ends of the wires to LVT-22,23 located in the unit control box.
3. Units on the CCN can be monitored from the space at the sensor through the RJ11 connector, if desired. To wire the RJ11 connector into the CCN (Fig. 25):

> IMPORTANT: The cable selected for the RJ11 connector wiring MUST be identical to the CCN communication bus wire used for the entire network. Refer to Table 12 for acceptable wiring.

4. Cut the CCN wire and strip ends of the red (+), white (ground), and black (–) conductors. (If another wire color scheme is used, strip ends of appropriate wires.)
5. Insert and secure the red (+) wire to terminal 5 of the space temperature sensor terminal block.
6. Insert and secure the white (ground) wire to terminal 4 of the space temperature sensor.

7. Insert and secure the black (–) wire to terminal 2 of the space temperature sensor.
8. Connect the other end of the communication bus cable to the remainder of the CCN communication bus.

SPT (T10) PART NO. 33ZCT55SPT
Fig. 24 — Typical Space Temperature Sensor Wiring
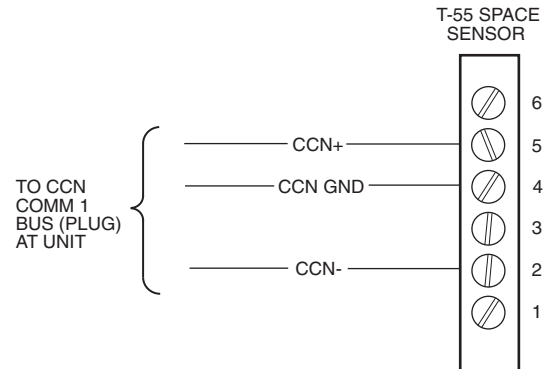

Fig. 25 — CCN Communications Bus Wiring to Optional Space Sensor RJ11 Connector

Dual Leaving Water Temperature Sensor

For dual chiller applications (parallel only are supported), connect the dual chiller leaving fluid temperature sensor (refer to Configuring and Operating Dual Chiller Control section on page 43) to the space temperature input of the Master chiller. If space temperature is required for reset applications, connect the sensor to the Slave chiller and configure the slave chiller to broadcast the value to the Master chiller. The sensor wire must not be routed with any power wire.

Energy Management Module

This factory-installed option (FIOP) or field-installed accessory is used for the following types of temperature reset, demand limit, and/or ice features: (See Fig. 26.)

- 4 to 20 mA leaving fluid temperature reset (requires field-supplied 4 to 20 mA generator)
- 4 to 20 mA cooling set point reset (requires field-supplied 4 to 20 mA generator)
- Discrete inputs for 2-step demand limit (requires field-supplied dry contacts capable of handling a 24 vac, 50 mA load)
- 4 to 20 mA demand limit (requires field-supplied 4 to 20 mA generator)
- Discrete input for Ice Done switch (requires field-supplied dry contacts capable of handling a 24 vac, 50 mA load)

See Temperature Reset and Demand Limit sections on pages 43 and 49 for further details.

⚠ CAUTION

Care should be taken when interfacing with other manufacturer's control systems due to possible power supply differences, full wave bridge versus half wave rectification. The two different power supplies cannot be mixed. *Comfort*Link controls use half wave rectification. A signal isolation device should be utilized if a full wave bridge signal generating device is used.

Loss-of-Cooler Flow Protection

A proof-of-cooler flow device is factory installed in all chillers. It is recommended that proper operation of the switch be verified on a regular basis.

Electronic Expansion Valves (EXVs)

All units are equipped from the factory with EXVs. Each refrigeration circuit is also supplied with a factory-installed liquid line filter drier and sight glass.

The EXV is set at the factory to maintain 9°F (5.0°C) suction superheat leaving the cooler by metering the proper amount of refrigerant into the cooler. The superheat set point is adjustable, *but should not be adjusted unless absolutely necessary*.

The EXV is designed to limit the cooler saturated suction temperature to 50°F (12.8°C). This makes it possible for unit to start at high cooler fluid temperatures without overloading the compressor.

Capacity Control

The control system cycles compressors, digital scroll modulating solenoid (if equipped), and minimum load valve solenoids (if equipped) to maintain the user-configured leaving chilled fluid temperature set point. Entering fluid temperature is used by the main base board (MBB) to determine the temperature drop across the cooler and is used in determining the optimum time to add or subtract capacity stages. The chilled fluid temperature set point can be automatically reset by the return fluid temperature, space, or outdoor-air temperature reset features. It can also be reset from an external 4 to 20 mA signal (requires energy management module FIOP or accessory).

The standard control has an automatic lead-lag feature built in which determines the wear factor (combination of starts and run hours) for each compressor. If all compressors are off and less than 30 minutes has elapsed since the last compressor was turned off, the wear factor is used to determine which compressor to start next. If no compressors have been running for more than 30 minutes and the leaving fluid temperature is greater than the saturated condensing temperature, the wear factor is still used to determine which compressor to start next. If the leaving fluid temperature is less than the saturated condensing temperature, then the control will start either compressor A1 or compressor B1 first, depending on the user-configurable circuit lead-lag value. For units with the minimum load control valve, the A circuit with the minimum load valve is always the lead circuit. The A circuit is also always the lead for units with the digital compressor option. On units with the digital scroll option, the A1 compressor operates continuously, providing close leaving chilled water control. For this reason, on/off cycling of the unit's compressors is dramatically reduced, which in turn reduces wear associated with compressor start/stop cycles.
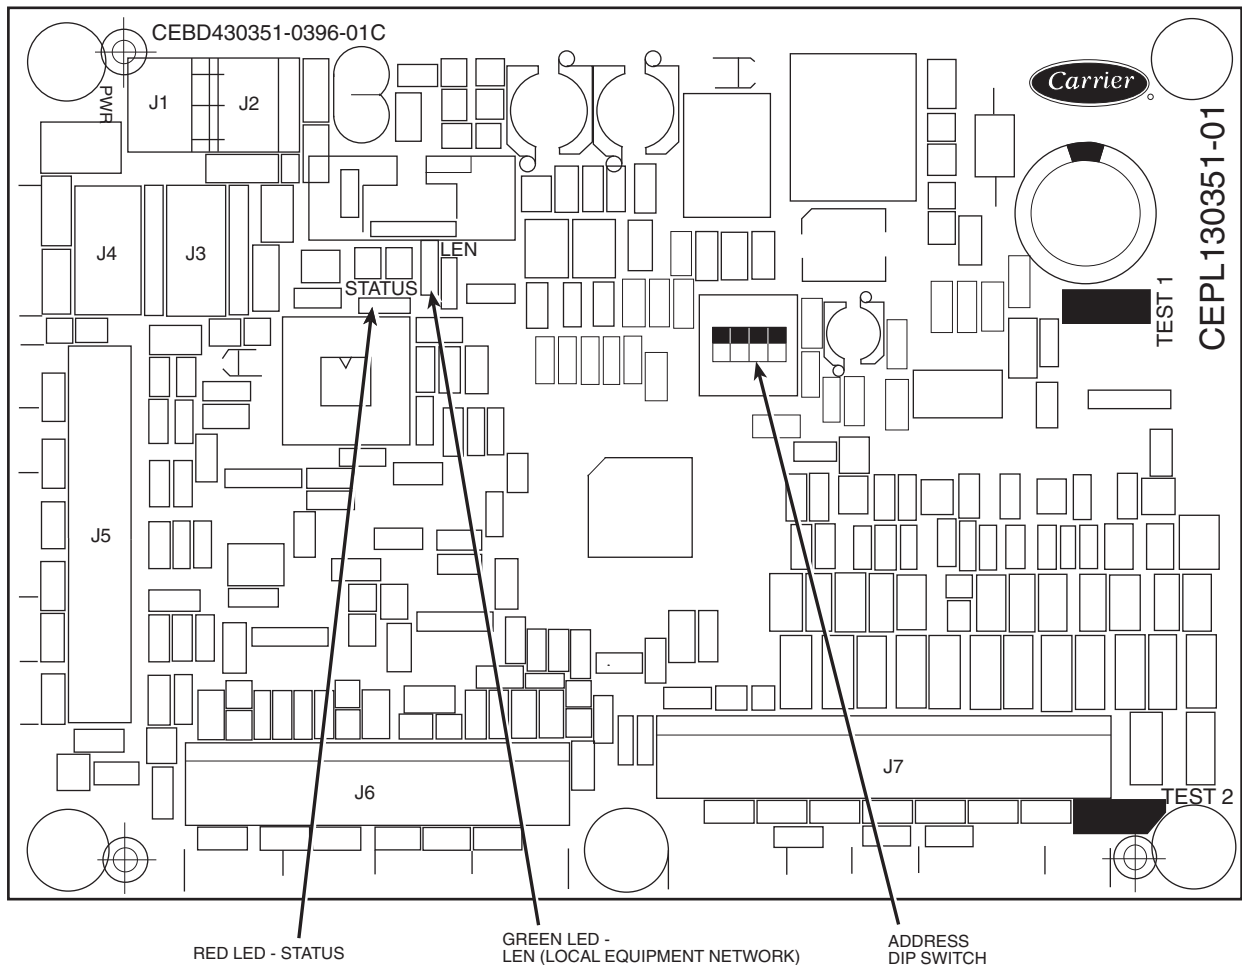

Fig. 26 — Energy Management Module

The EXVs will provide a controlled start-up. During start-up, the low pressure logic will be bypassed for 2-1/2 minutes to allow for the transient changes during start-up. As additional stages of compression are required, the processor control will add them. See Table 13.

If a circuit is to be stopped, the compressor with the lowest wear factor will be shut off first except when a digital compressor is used. The digital compressor is always the last compressor to shut off.

The capacity control algorithm runs every 30 seconds. The algorithm attempts to maintain the Control Point at the desired set point. Each time it runs, the control reads the entering and leaving fluid temperatures. The control determines the rate at which conditions are changing and calculates 2 variables based on these conditions. Next, a capacity ratio is calculated using the 2 variables to determine whether or not to make any changes to the current stages of capacity. This ratio value ranges from –100 to +100%. If the next stage of capacity is a compressor, the control starts (stops) a compressor when the ratio reaches +100% (–100%). If installed, the minimum load valve solenoid will be energized with the first stage of capacity. Minimum load valve value is a fixed 30% in the total capacity calculation. The control will also use the minimum load valve solenoid as the last stage of capacity before turning off the last compressor. A delay of 90 seconds occurs after each capacity step change. Refer to Table 14.

MINUTES LEFT FOR START

This value is displayed only in the network display tables (using Service Tool, ComfortVIEW™ or ComfortWORKS™ software) and represents the amount of time to elapse before the unit will start its initialization routine. This value can be zero without the machine running in many situations. This can include being unoccupied, Enable/Off/Remote Control switch in the Off position, CCN not allowing unit to start, Demand Limit in effect, no call for cooling due to no load, and alarm or alert conditions present. If the machine should be running and none of the above are true, a minimum off time (DELY, see below) may be in effect. The machine should start normally once the time limit has expired.

MINUTES OFF TIME

(*Configuration→OPT2→ DELY*)

This user-configurable time period is used by the control to determine how long unit operation is delayed after power is applied/restored to the unit. Typically, this time period is configured when multiple machines are located on a single site. For example, this gives the user the ability to prevent all the units from restarting at once after a power failure. A value of zero for this variable does not mean that the unit should be running.

LEAD/LAG DETERMINATION

This is a configurable choice and is factory set to be automatic for all units. The 30RAP units offer an optional digital compressor. When the unit is equipped with a digital scroll compressor and enabled *(Configuration→UNIT→A1.TY=YES)*, or minimum load, then circuit A is lead *(Configuration→OPT2→LLCS)*.

If the unit is equipped with Minimum Load Valve (MLV) and option has been enabled, Circuit A will be the last circuit on as capacity is decreasing for the MLV to be active for the last stage of capacity.

The value can be changed to Circuit A or Circuit B leading as desired. Set at automatic, the control will sum the current number of logged circuit starts and one-quarter of the current operating hours for each circuit. The circuit with the lowest sum is started first. Changes to which circuit is the lead circuit and which is the lag are also made when total machine capacity is at 100% or when there is a change in the direction of capacity (increase or decrease) and each circuit's capacity is equal.

LOADING SEQUENCE SELECT

This is configurable as equal circuit loading or staged circuit loading with the default set at equal *(Configuration→ OPT2→LOAD)*. The control determines the order in which the steps of capacity for each circuit are changed. Set to equal, the unit will alternate starting compressors in each circuit as the requirement increases. Set to staged, one circuit will load completely before the second circuit is started. This control choice does NOT have any impact on machines with only one circuit or units with 2 compressors - one in each circuit.

LOW AMBIENT LOCKOUT

The control software has a feature that allows the user to select an outdoor air temperature (OAT) at which mechanical cooling will be disabled. To use this feature, set OAT Lockout Temperature *(Set Points→ COOL→OAT.L)* to a value between –19 and 120°F (–28.3 and 48.9°C). This value should be set to the desired temperature at which no mechanical cooling is required. Any time the feature is active due to the outdoor air temperature being below the field programmed value, the machine will indicate OAT Below Lockout Temp *(Operating Modes→MODE→ MD.OL= ON)*. Mechanical cooling will be enabled once the Outdoor Ambient is 3°F (1.6°C) above the *OAT.L* set point. The factory default is –20°F (–28.9°C) and indicates that this feature is disabled. If an Outdoor Air Temperature Sensor failure is declared, this feature must be disabled by setting the *OAT.L* to –20°F (–28.9°C), to allow the unit to operate.

CAPACITY CONTROL OVERRIDES

The following overrides will modify the normal operation of the routine.

Deadband Multiplier

The user configurable Deadband Multiplier *(Configuration→ SLCT→Z.GN)* has a default value of 1.0. The range is from 1.0 to 4.0. When set to other than 1.0, this factor is applied to the capacity Load/Unload Factor. The larger this value is set, the longer the control will delay between adding or removing stages of capacity. Fig. 27 shows how compressor starts can be reduced over time if the leaving water temperature is allowed to drift a larger amount above and below the set point. This value should be set in the range of 3.0 to 4.0 for systems with small loop volumes.

First Stage Override

If the current capacity stage is zero, the control will modify the routine with a 1.2 factor on adding the first stage to reduce cycling. This factor is also applied when the control is attempting to remove the last stage of capacity.

SLOW CHANGE OVERRIDE

The control prevents the capacity stages from being changed when the leaving fluid temperature is close to the set point (within an adjustable deadband) and moving towards the set point.

Table 13 — Part Load Data Percent Displacement, Standard Units with Minimum Load Valve

30RAP UNIT SIZE	CONTROL STEPS	CAPACITY STEPS % DISPLACEMENT	CAPACITY % CIRCUIT A	CAPACITY % CIRCUIT B

NOTE: These capacity steps may vary due to different capacity staging sequences.

DEADBAND EXAMPLE
LEGEND
LWT — Leaving Water Temperature

Fig. 27 — Deadband Multiplier

Ramp Loading

Ramp loading (*Configuration→SLCT→ CRMP*) limits the rate of change of leaving fluid temperature. If the unit is in a Cooling mode and configured for Ramp Loading, the control makes 2 comparisons before deciding to change stages of capacity. The control calculates a temperature difference between the control point and leaving fluid temperature. If the difference is greater than 4°F (2.2°C) and the rate of change (°F or °C per minute) is more than the configured Cooling Ramp Loading value (*CRMP*), the control does not allow any changes to the current stage of capacity.

Low Entering Fluid Temperature Unloading

When the entering fluid temperature is below the control point, the control will attempt to remove 25% of the current stages being used. If exactly 25% cannot be removed, the control removes an amount greater than 25% but no more than necessary. The lowest stage will not be removed.

Minimum Load Control

If equipped, the minimum load control valve is energized only when one compressor is running on Circuit A and capacity is decreasing, provided that the minimum run time for Circuit B compressors has been satisfied.

Cooler Freeze Protection

The control will try to prevent shutting the chiller down on a Cooler Freeze Protection alarm by removing stages of capacity. If the cooler fluid selected is Water, the freeze point is 34°F (1.1°C). If the cooler fluid selected is Brine, the freeze point is the Brine Freeze Point (*Set Points→FRZ→BR.FZ*). This alarm condition (A207) only references leaving fluid temperature and NOT Brine Freeze point. If the cooler leaving fluid temperature is less than the freeze point plus 2.0°F (1.1°C), the control will immediately remove one stage of capacity. This can be repeated once every 30 seconds.

Low Saturated Suction Protection

The control will try to prevent shutting a circuit down due to low saturated suction conditions by removing stages of capacity. These circuit alert conditions (T116, T117) compare saturated suction temperature to the configured Brine Freeze Point (*Set Points→ FRZ→ BR.FZ*). The Brine Freeze point is a user-configurable value that must be left at 34°F (1.1°C) for 100% water systems. A lower value may be entered for systems with brine solutions, but this value should be set according to the freeze protection level of the brine mixture. Failure to properly set this brine freeze point value may permanently damage the brazed plate heat exchanger. The control will initiate Mode 7 (Circuit A) or Mode 8 (Circuit B) to indicate a circuit's capacity is limited and that eventually the circuit may shut down.

Head Pressure Control

The main base board (MBB) controls the condenser fans to maintain the lowest condensing temperature possible, and thus the highest unit efficiency. The MBB uses the saturated condensing temperature input from the discharge pressure transducer and outside air temperature sensor to control the fans. Head pressure control is maintained through a calculated set point which is automatically adjusted based on actual saturated condensing and saturated suction temperatures so that the compressor(s) are always operating within the manufacturer's specified envelope (Fig. 28 and 29). If OAT is greater than 70°F before a circuit is starting, then all condenser fan stages will be energized. A fan stage is increased based on SCT (saturated condensing temperature). When the highest SCT is greater than the Fan On Set Point (*Set Points→HEAD→F.ON*), then an additional stage of fan will be added to the current fan stage. Fan On Set Point (*F.ON*) equals Head Set Point (*Set Points→HEAD→H.DP*) except after a fan stage increase when the Head Set Point is increased by Fan Stage Delta (*Set Points→HEAD→F.DLT*). A fan stage is decreased when the SCTs of both circuits are less than the Fan Off Set Point (*Set Points→HEAD →F.OFF*) for two minutes. Table 14 shows the number of fan stages, contactors energized and the fans that are on during the fan stage. Unit sizes 035 to 060 have common fan control. Figure 30 shows the location of each fan and control box within the unit.

MOTORMASTER® V OPTION

The Motormaster V controller is standard on 30RAP010 and 015 size units. For all other standard (non-Greenspeed/HEVCF) units that need low-ambient operation, the lead fan on a circuit can be equipped with the Motormaster V head pressure controller option or accessory. The controller is energized with the first fan stage and adjusts fan speed to maintain a SCT of 72°F (22.2°C). The first stage of fan operation is controlled by the Motormaster V controller. Refer to Fig. 30 for condenser fan layout information. The Motormaster is configured in Motormaster Select (*Configuration→MM→MMR.S=1*(LOW AMBIENT)).

High-Efficiency Variable Condenser Fans

30RAP011-060 WITH GREENSPEED® INTELLIGENCE

This option controls the speed of all fans for improvement in part load efficiency and sound levels. All fans run at the same speed. High-Efficiency Variable Condenser Fans (HEVCF) is standard on 30RAP011 and 016 size units; it is not available on sizes 30RAP010 and 015. HEVCF is configured in Motormaster Select (*Configuration→MM→MMR.S=2* (GREENSPEED)).

For the HEVCF option, the following parameters should also be configured from the factory exactly as shown in Table 15.

Table 15 — HECVF Configuration

UNIT VOLTAGE	VOLTS (Configuration→Unit→VLTS)
575-3-60	575
380-3-60	380
208/230-3-60	208 or 230
460-3-60	460
380/415-3-50	400
Unit Fan Type	Fan Poles (Configuration→Unit→F.POL)
Low Sound Fan	8
Metal Fan	6

FAN DRIVE OPERATION

The HEVCF option uses Danfoss VLT 102 variable frequency drives. Drives are connected to the LEN communication bus. Fan speed is determined by the chiller controller and communicated to the drive. The drive must be set at Auto On mode.

Fan speed is controlled to maintain SCT set point. The set point is calculated from conditions and adjusted to the most efficient operating point.

Drive parameters are set by the chiller control each time the unit power is cycled with the exception of the drive address. The drive address is set at the factory to 184 at Drive Parameter 8-31, but will have to be configured in case of drive replacement. If the drive address is not set correctly, the control would display Alarm A179.

The address is configured using the display on the drive. See drive manual for detailed instructions. Once the address is set, the power is cycled to reset all other parameters in the drive. Other parameters are listed in Tables 16 and 17 for reference. Drive must be in "Auto" mode to operate. Push the "Auto" button at the bottom of the drive; the light above it will be on.

The drive front cover is secured by a T-20 screw; the nominal torque is 18 inch-pounds (2 N•m). Refer to the power and control wiring diagrams for all wiring requirements. Note the shield from the LEN cable shall be attached to VFD ground.

Fan motor troubleshooting should be done at the main control box. Disconnect power from unit. All fan motors are connected to Terminal Block 2. Disconnect each fan cable and check resistance of motor. An open or short reading between phases or a phase and ground could signify a failed fan motor. Verify reading at motor before replacing. Reconnect wires using label coding L1, L2, and L3. Replace main control box cover, and power up the unit to test fan operation.

Drive alarms are shown on the chiller controls as A179, A412, and A413. Refer to Alarms and Alerts section starting on page 92 for a complete list of alarms and the common alarms with possible causes. For more details see the drive manual supplied with the chiller.

Drives and motors are protected by fuses for short circuit protection. See the Service Test section for details. Fan motor overload protection is provided by an overload device internal to the motor. The motor overload responds to a combination of temperature and current. On overload condition, the device breaks all 3 phases to the motor. It will reset automatically once the motor temperature cools.

Table 16 — High-Efficiency Fan Drive Parameters

Operation of Machine Based on Control Method and Cooling Set Point Selection Settings

Machine On/Off control is determined by the configuration of the Control Method (*Configuration→ OPT2→CTRL*) and Cooling Set Point Select (*Configuration→SLCT→CLSP*) variables. All units are factory configured with Cooling Set Point Select set to 0 (single set point). With the control method set to 0, simply switching the Enable/Off/Remote Control switch to the Enable or Remote Control position (external contacts closed) will put the chiller in an occupied state. The control mode (*Operating Modes→MODE*) will be 1 (OFF LOCAL) when the switch is Off and will be 5 (ON LOCAL) when in the Enable position or Remote Control position with external contacts closed.

Two other control methods are available for Machine On/Off control:

OCCUPANCY SCHEDULE

(*Configuration→OPT2→ CTRL = 2*)

The main base board will use the operating schedules as defined under the Time Clock mode in the scrolling marquee display. These schedules are identical. The schedule number must be set to 1 for local schedule.

The schedule number can be set anywhere from 65 to 99 for operation under a CCN global schedule. The Enable/Off/Remote Control switch must be in the Enable or Remote Control position. The control mode (*Operating Modes→MODE*) will be 1 when the switch is Off. The control mode will be 3 when the Enable/Off/Remote Control switch input is On and the time of day is during an unoccupied period. Similarly, the control mode will be 7 when the time of day is during an occupied period.

CCN CONTROL

(*Configuration→OPT2→CTRL = 3*)

An external CCN device such as Chillervisor System Manager controls the On/Off state of the machine. This CCN device forces the variable "CHIL_S_S" between Start/Stop to control the chiller. The control mode (*Operating Modes→MODE*) will be 1 when the Enable/Off/Remote Control switch is Off. The control mode will be 2 when the Enable/Off/Remote Control switch input is On and the CHIL_S_S variable is "Stop". Similarly, the control mode will be 6 when the CHIL_S_S variable is "Start".

Table 18 illustrates how the control method and cooling set point select variables direct the operation of the chiller and the set point to which it controls. The illustration also shows the ON/OFF state of the machine for the given combinations.

Table 18 — Control Methods and Cooling Set Points

CONTROL TYPE (CTRL)	OCCUPANCY STATE	COOLING SET POINT SELECT (CLSP)			
		0 (SINGLE)	1 (DUAL, SWITCH)	2 (DUAL, OCC)	3 (4 TO 20 MA)
0 (switch)	Occupied	ON,CSP1	ON*	ON,CSP1	ON†
	Unoccupied	ON,CSP1	ON*	ON,CSP2	ON
2 (Occupancy)	Occupied	ON,CSP1	ON*	Illegal	ON†
	Unoccupied	OFF	OFF	Illegal	OFF
3 (CCN)	Occupied	ON,CSP1	ON*	ON,CSP1	ON†
	Unoccupied	ON,CSP1	ON*	ON,CSP2	ON†

*Dual set point switch input used. CSP1 used when switch input is open. CSP2 used when switch input is closed.
†Cooling set point determined from 4 to 20 mA input to energy management module (EMM) to terminals LVT-10,8.

Cooling Set Point Select

Table 19 lists cooling set point limits.

Table 19 — Cooling Set Point Limits

SET POINT LIMIT	COOLER FLUID TYPE, *FLUD*	
	1 = WATER	2 = MEDIUM BRINE
MINIMUM	40 F (4.4 C)	14 F (–10.0 C)
MAXIMUM	70 F (21.1 C)	

SINGLE

Unit operation is based on Cooling Set Point 1 (*Set Points→COOL→CSP.1*).

DUAL SWITCH

Unit operation is based on Cooling Set Point 1 (*Set Points→COOL→CSP.1*) when the Dual Set Point switch contacts are open and Cooling Set Point 2 (*Set Points→COOL→CSP.2*) when they are closed.

DUAL CCN OCCUPIED

Unit operation is based on Cooling Set Point 1 (*Set Points→COOL→CSP.1*) during the Occupied mode and Cooling Set Point 2 (*Set Points→COOL→CSP.2*) during the Unoccupied mode as configured under the local occupancy schedule accessible only from CCN. Schedule Number in Table SCHE-DOVR (See Appendix B) must be configured to 1. If the Schedule Number is set to 0, the unit will operate in a continuous 24-hr Occupied mode. Control method must be configured to 0 (switch). See Table 18.

4 TO 20 MA INPUT

Unit operation is based on an external 4 to 20 mA signal input to the Energy Management Module (EMM). Refer to page 30.

CONFIGURATION SET POINT LIMITS

Table 20 lists configuration set point limits.

Table 20 — Configuration Set Point Limits

SET POINT LIMIT	COOLER FLUID TYPE (FLUD)	
	1 = WATER	2 = BRINE
MINIMUM	40°F (4.4°C)	14°F (–10.0°C)
MAXIMUM	60°F (15.5°C)	

Ice Mode

When Ice Mode is enabled (*Configuration→OPT2→ICE.M*), Cooling Setpoint Select (*Configuration→SLCT→CLSP*) must be set to Dual Switch or Dual CCN Occupied. The Energy Management Module (EMM) must be installed. Unit operation is based on Cooling Setpoint 1 (*CSP.1*) during the Occupied mode, Ice Setpoint (*CSP.3*) during the Unoccupied mode with the Ice Done contacts open, and Cooling Setpoint 2 (*CSP.2*) during the Unoccupied mode with the Ice Done contacts closed. These 3 set points can be utilized to develop your specific control strategy.

Cooling Set Point (4 to 20 mA)

A field supplied and generated, externally powered 4 to 20 mA signal input to the Energy Management Module (EMM) can be used to provide the leaving fluid temperature set point. Connect the signal to LVT10,8 (+,–). Figure 31 shows how the 4 to 20 mA signal is linearly calculated on an overall 10°F to 80°F (–12.2 to 26.7°C) range for fluid types (*Configuration→OPT1→FLUD*) 1 or 2. The set point will be limited by the fluid (*FLUD*) type. Be sure that the chilled water loop is protected at the lowest temperature. See Table 21.
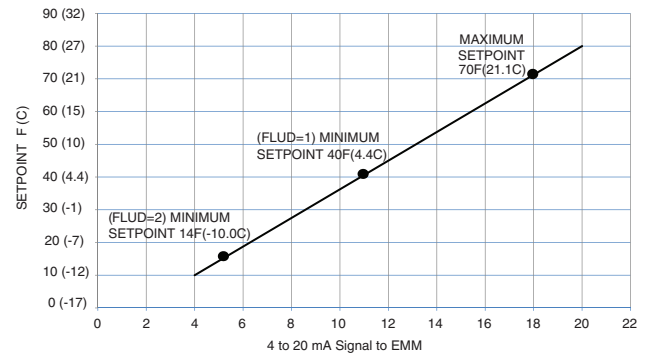

EMM — Energy Management Module

Low Sound Mode Operation

All models are factory configured with the Low Sound Mode disabled. In the Configuration mode under sub-mode OPT2, items for Low Sound Mode Select (*Configuration→OPT2→LS.MD*), Low Sound Start Time (*Configuration→OPT2→LS.ST*), Low Sound End Time (*Configuration→OPT2→LS.ND*) and Low Sound Capacity Limit (*Configuration→OPT2→LS.LT*) are factory configured so that the chiller always runs as quietly as possible. This results in operation at increased saturated condensing temperature. As a result, some models may not be able to achieve rated efficiency. For chiller operation at rated efficiency, disable the low sound mode or adjust the low sound mode start and stop times accordingly or set both times to 00:00 for rated efficiency operation 24 hours per day. In addition, the low sound capacity limit can be used to reduce overall chiller capacity, if required, by limiting the maximum to a user-configured percentage.

Heating Operation

The chiller can be used for pump outputs or optional factory-installed hydronic system operation can be utilized for heating applications. The heating mode is activated when the control sees a field-supplied closed switch input to terminal block LVT-19,20. The control locks out cooling when the heat relay input is seen. A field-supplied boiler relay connection is made using heat relay and alarm relay contacts. Factory-installed "BOILER" connections exist in the control panel near LVT for these applications. Alarms and alerts A189 through A202 are active during heating operation.

Service Test

Both main power and control circuit power must be on.

The Service Test function should be used to verify proper operation of condenser fan(s), compressors, minimum load valve solenoid (if installed), cooler pump(s), EXVs, and remote alarm relay. To use the Service Test mode, the Enable/Off/Remote Control switch must be in the Off position. Use the Service Test Mode and Sub-Mode Directory table in Appendix A to enter the mode and display TEST. Press ENTER twice so that Off flashes. Enter the password if required. Use either arrow key to change the TEST value to the ON position and press ENTER. Press ESCAPE and the ▼ button to enter the OUTS or COMP sub-mode.

Test the condenser fans, cooler pump(s), and alarm relay by changing the item values from OFF to ON. These discrete outputs are then turned off if there is no keypad activity for 10 minutes. Use the arrow keys to select the desired percentage when testing expansion valves and Motormaster® V controller. When testing compressors, lead compressor must be started first. All compressor outputs can be turned on, but the control will limit the rate by staging one compressor per minute. Compressor unloaders and hot gas bypass relays/solenoids (if installed) can be tested with the compressors on or off. The relays under the COMP mode will stay on for 10 minutes if there is no keypad activity. Compressors will stay on until they are turned off by the operator. The Service Test mode will remain enabled for as long as there is one or more compressors running. All safeties are monitored during this test and will turn a compressor, a circuit, or the machine off if required. Any other mode or sub-mode can be accessed, viewed, or changed during the TEST mode. The MODE item (*Run Status→VIEW*) will display "0" as long as the Service mode is enabled. The TEST sub-mode value must be changed back to OFF before the chiller can be switched to Enable or Remote Control for normal operation.

The pump(s) in the hydronic package come factory pre-wired into the main unit power supply/starter. In order to check proper pump rotation, use the Service Test function to test the condenser fans and observe them for proper rotation. If fans turn correctly, the pumps will rotate correctly. Clockwise rotation of the pump motor cooling fans can also be used to determine that pumps are rotating correctly.

Use Service Test function to test operation of pumps. Verify that the flow switch input is made when the pump is running. For dual pump hydronic systems, the control only uses one pump at a time. Consult the Installation Instructions supplied with this chiller and use the circuit setter balancing valve installed in hydronic package to adjust fluid flow rate.

Optional Factory-Installed Hydronic Package

If the chiller has factory-installed chilled fluid pumps, specific steps should be followed for proper operation.

Cooler Pump Control

The AquaSnap® 30RAP machines equipped with a factory-installed pump package are configured with the Cooler Pump Control (*Configuration→OPT1→CPC*) = ON.

Machines not equipped with a pump package are configured with the cooler pump control OFF. It is recommended that the machine control the chilled water pump. If not, a 5-minute time delay is required after command to shut machine down is sent before chilled water pump is turned off. This is required to maintain water flow during shutdown period of the machine.

With or without this option enabled, the cooler pump relay will be energized when the machine enters an ON status (i.e., On Local, On CCN, On Time). An A207 — Cooler Freeze Protection Alarm will energize the cooler pump relay also, as an override. The cooler pump relay will remain energized if the machine is in MODE 10 – Minimum Off Time.

Cooler Pump Operation

Two options of pump operation are available with 30RAP units (*Configuration→OPT1→PMP.O*).

The factory default for **PMP.O** is 0 (Auto) for automatic. In this mode, the pump will be energized any time the unit is enabled, or for a freeze condition. The pump will be de-energized in any alarm other than A207 – Cooler Freeze Protection alarm.

If **PMP.O** is set to 1 (Continuous), the chilled water pump will be energized any time the unit is enabled. If the unit is in an alarm condition, the pump will remain energized. Because of this feature, a High Temperature Cut-Off variable, *Configuration→OPT1→PM.HT* has been added for field configuration. If the leaving chilled water temperature exceeds the configured value, the pump will shut off to avoid overheating the chilled loop. The factory default is 95°F (35°C) and has a range of 95 to 125°F (35 to 52°C). This variable is only active when **PMP.O** is set to 1.

Cooler Pump Sequence of Operation

At any time the unit is in an ON status, as defined by the one of the following conditions, the cooler pump relay will be enabled.

1. Enable-Off-Remote Switch in ENABLE, (**CTRL=0**).
2. Enable-Off-Remote Switch in REMOTE with a Start-Stop Remote Control closure (**CTRL=0**).
3. An Occupied Time Period from an Occupancy Schedule in combination with items 1 or 2 (**CTRL=2**).
4. A CCN Start-Stop Command to Start in combination with items 1 or 2 (**CTRL=3**).

As stated before, there are certain alarm conditions and Operating Modes that will turn the cooler pump relay ON. This sequence will describe the normal operation of the pump control algorithm.

When the unit cycles from an "On" state to an "Off" state, the cooler pump output will remain energized for the Cooler Pump Shutdown Delay (*Configuration→OPT1→PM.DY*). This is configurable from 0 to 10 minutes. The factory default is 1 minute.

NO INTEGRAL PUMP — SINGLE EXTERNAL PUMP CONTROL

With a single external pump, the following options must be configured:

- Cooler Pump Control (*Configuration→OPT1→CPC*) = **OFF**.
- Cooler Pump 1 Enable (*Configuration→OPT1 →PM1E*) = **NO**.
- Cooler Pump 2 Enable (*Configuration→OPT1 →PM2E*) = **NO**.

The maximum load allowed for the Chilled Water Pump Starter is 5 VA sealed, 10 VA inrush at 24 volts. The starter coil is powered from the chiller control system. The starter should be wired between LVT-25 and LVT-21. If equipped, the field-installed chilled water pump starter auxiliary contacts should be connected in series with the chilled water flow switch.

The Cooler Pump Relay will be energized when the machine is "On." The chilled water pump interlock circuit consists of a chilled water flow switch and a field-installed chilled water interlock. If the chilled water pump interlock circuit does not close within five (5) minutes of starting, an A200 — Cooler Flow/Interlock Failed to Close at Start-Up Alarm will be generated and chiller will not be allowed to start.

If the chilled water pump interlock or chilled water flow switch opens for at least three (3) seconds after initially being closed, an A201 — Cooler Flow/Interlock Contacts Opened During Normal Operation Alarm will be generated and the machine will stop.

NO INTEGRAL PUMP — DUAL EXTERNAL PUMP CONTROL

With two external pumps, the following options must be configured:

- Cooler Pump Control (*Configuration→OPT1→CPC*) = **ON**.
- Cooler Pump 1 Enable (*Configuration→OPT1 →PM1E*) = **YES**.
- Cooler Pump 2 Enable (*Configuration→OPT1 →PM2E*) = **YES**.

The maximum load allowed for the Chilled Water Pump Starters is 5 VA sealed, 10 VA inrush at 24 volts. The starter coil is powered from the chiller control system. The starter for Chilled Water Pump 1 should be wired between LVT-25 and LVT-21. The starter for Chilled Water Pump 2 should be wired between LVT-24 and LVT-21. A field-installed chilled water pump interlock for each pump must be connected to each pump's interlock points on the main base board. The chilled water pump 1 interlock, CWP1, must be connected to MBB-J7-1 and -2. The chilled water pump 2 interlock, CWP2, must be connected to MBB-J7-3 and -4. The chilled water pump interlock contacts should be rated for dry circuit application capable of handling 5 vdc at 2 mA.

SINGLE INTEGRAL PUMP CONTROL

With a single pump, the following options must be configured:

- Cooler Pump Control (*Configuration→OPT1→CPC*) = **ON**.
- Cooler Pump 1 Enable (*Configuration→OPT1 →PM1E*) = **YES**.
- Cooler Pump 2 Enable (*Configuration→OPT1 →PM2E*) = **NO**.

With a single integral pump, the Cooler Pump Starter will be energized when the machine is occupied. As part of the factory-installed package, an auxiliary set of contacts is wired to the MBB to serve as Chilled Water Pump Interlock. When the mechanical cooling is called for, the pump interlock and flow switch is checked. If the circuits are closed, the machine starts its capacity routine. If the auxiliary contact interlock does not close within 25 seconds of the ON command, a T190 — Cooler Pump 1 Aux Contacts Failed to Close at Start-Up Alert will be generated and the pump shut down. The unit will not be allowed to start. If the chilled water flow switch does not close within one (1) minute, two alarms will be generated. A T192 — Cooler Pump 1 Failed to Provide Flow at Start-Up Alert and an A200 — Cooler Flow/Interlock Failed to Close at Start-Up Alarm will be generated and chiller will not be allowed to start.

If the chilled water flow switch opens for at least 3 seconds after initially being closed, a T196 — Flow Lost While Pump 1 Running Alert and an A201 — Cooler Flow/Interlock Contacts

Opened During Normal Operation Alarm will be generated and the machine will stop.

If the control detects the chilled water pump interlock open for 25 seconds after initially being closed, a T194 — Cooler Pump 1 Contacts Opened During Normal Operation Alert is generated and the unit is shut down.

If the control detects the chilled water flow switch circuit closed for at least 5 minutes with the pump output OFF, an A202 — Cooler Pump Interlock Closed When Pump is Off Alarm will be generated and the unit will not be allowed to start.

If the control detects that the chilled water pump auxiliary contacts are closed for at least 25 seconds while the pump is OFF, a T198 — Cooler Pump 1 Aux Contacts Closed While Pump Off Alert is generated. The chiller will not be allowed to start.

If the control starts a pump and the wrong interlock circuit closes for at least 20 seconds, an A189 — Cooler Pump and Aux Contact Input Miswire Alarm will be generated. The unit will be prevented from starting.

As part of a pump maintenance routine, the pump can be started to maintain lubrication of the pump seal. To utilize this function, Cooler Pmp Periodic Start (*Configuration→OPT1 →PM.P.S*) must be set to YES. This option is set to NO as the factory default. With this feature enabled, if the pump is not operating, it will be started and operated for 2 seconds starting at 14:00 hours. If the pump is operating, this routine is skipped. If the pump has failed and an Alarm/Alert condition is active, the pump will not start that day.

DUAL INTEGRAL PUMP CONTROL

With a dual integral pump package, the following options must be configured:

- Cooler Pump Control (*Configuration→OPT1→CPC*) = **ON**.

- Cooler Pump 1 Enable (*Configuration→OPT1 →PM1E*) = **YES**.

- Cooler Pump 2 Enable (*Configuration→OPT1 →PM2E*) = **YES**.

Pump Start Selection is a field-configurable choice. Cooler Pump Select (*Configuration→OPT1→PM.SL*) is factory defaulted to 0 (Automatic). This value can be changed to 1 (Pump 1 Starts First) or 2 (Pump 2 Starts First). If *PM.SL* is 0 (Automatic), the pump selection is based on two criteria: the alert status of a pump and the operational hours on the pump. If a pump has an active Alert condition, it will not be considered for the lead pump. The pump with the lowest operational hours will be the lead pump. A pump is selected by the control to start and continues to be the lead pump until the Pump Changeover Hours (*Configuration→OPT1→PM.DT*) is reached.

The Lead Pump (*Run Status→VIEW→LD.PM*) indicates the pump that has been selected as the lead pump: 1 (Pump 1), 2 (Pump 2), 3 (No Pump). The Pump Changeover Hours is factory defaulted to 500 hours. Regardless of the Cooler Pump Selection, any pump that has an active alert will not be allowed to start.

With the dual integral pump package, the Cooler Pump Starter will be energized when the machine is in an occupied period. As part of the factory-installed package, an auxiliary set of contacts is wired to the MBB to serve as Chilled Water Pump Interlock, one set for each pump to individual channels on the MBB. With a call for mechanical cooling, the specific pump   interlock and flow switch are checked. If the circuits are closed, the machine starts its capacity routine. If Pump 1 starts and the auxiliary contact interlock does not close within 25 seconds of the ON command, a T190 — Cooler Pump 1 Aux Contacts Failed to Close at Start-Up Alert will be generated and the pump shut down. The unit will not be allowed to start. If the chilled water flow switch does not close within 1 minute, two alarms will be generated. A T192 — Cooler Pump 1 Failed to Provide Flow at Start-Up Alert and an A200 — Cooler Flow/Interlock Failed to Close at Start-Up Alarm will be

generated and chiller will not be allowed to start. In either fault case listed above, Pump 2 will be commanded to start once Pump 1 has failed.

If Pump 2 starts and the auxiliary contact interlock does not close within 25 seconds of the ON command, a T191 — Cooler Pump 2 Aux Contacts Failed to Close at Start-Up Alert will be generated and the pump shut down. The unit will not be allowed to start. If the chilled water flow switch does not close within one (1) minute, two alarms will be generated. A T193 — Cooler Pump 2 Failed to Provide Flow at Start-Up Alert and an A200 — Cooler Flow/Interlock Failed to Close at Start-Up Alarm will be generated and chiller will not be allowed to start. In either fault case listed above, Pump 1 will be commanded to start once Pump 2 has failed.

If the chilled water flow switch opens for at least 3 seconds after initially being closed, a T196 — Flow Lost While Pump 1 Running Alert or T197 — Flow Lost While Pump 2 Running Alert for the appropriate pump and an A201 — Cooler Flow/Interlock Contacts Opened During Normal Operation Alarm will be generated and the machine will stop. If available, the other pump will be started. If flow is proven, the machine will be allowed to restart.

If a chilled water pump interlock that opens for 25 seconds after initially being closed is detected by the control, the appropriate T194 — Cooler Pump 1 Contacts Opened During Normal Operation Alert or T195 — Cooler Pump 2 Contacts Opened During Normal Operation Alert is generated and the unit is shut down. If available, the other pump will be started. If flow is proven, the machine will be allowed to restart.

If the control detects that the chilled water flow switch circuit is closed for at least 5 minutes with the pump output OFF, an A202 — Cooler Pump Interlock Closed When Pump is Off Alarm will be generated and the unit will not be allowed to start.

If the control detects that the chilled water pump auxiliary contacts are closed for at least 25 seconds while the pump is OFF, the appropriate T198 — Cooler Pump 1 Aux Contacts Closed While Pump Off or Alert T199 — Cooler Pump 2 Aux Contacts Closed While Pump Off Alert is generated. The chiller will not be allowed to start.

If the control starts a pump and the wrong interlock circuit closes for at least 20 seconds, an A189 – Cooler Pump and Aux Contact Input Miswire Alarm will be generated. The unit will be prevented from starting.

The control will allow for pump changeover. Two methods will change the pump sequence. Before the changeover can occur, the unit must be at Capacity Stage 0. During changeover the chilled water flow switch input is ignored for 10 seconds to avoid a nuisance alarm.

With Cooler Pump Select (*Configuration→OPT1→ PM.SL*) set to 0 (Automatic) and when the differential time limit Pump Changeover Hours (*Configuration→OPT1→PM.DT*) is reached, the lead pump will be turned OFF. Approximately one (1) second later, the lag pump will start. Manual changeover can be accomplished by changing Rotate Cooler Pump Now (*Configuration→OPT1→ROT.P*) to YES only if the machine is at Capacity Stage 0 and the differential time limit Pump Changeover Hours (*PM.DT*) is reached. If the *PM.DT* is not satisfied, the changeover will not occur. With the machine at Capacity Stage 0, the pumps would rotate automatically as part of the normal routine.

With Cooler Pump Select (*PM.SL*) set to 1 (Pump 1 Starts First) or 2 (Pump 2 Starts First), a manual changeover can be accomplished by changing *PM.SL* only. The machine Remote-Off-Enable Switch must be in the OFF position to change this variable. The Rotate Cooler Pump Now (*ROT.P*) feature does not work for these configuration options.

As part of a pump maintenance routine, the pumps can be started to maintain lubrication to the pump seal. To utilize this function, Cooler Pmp Periodic Start (*Configuration→OPT1 →PM.PS*) must be set to YES. This option is set to NO as the factory default. If feature is enabled and the pump(s) are not operating, then the

pumps will be operated every other day for 2 seconds starting at 14:00 hours. If a pump has failed and has an active Alert condition, it will not be started that day.

Configuring and Operating Dual Chiller Control

The dual chiller routine is available for the control of two units supplying chilled fluid on a common loop. This control algorithm is designed for parallel fluid flow arrangement only. One chiller must be configured as the master chiller, the other as the slave. An additional leaving fluid temperature thermistor (Dual Chiller LWT) must be installed as shown in Fig. 32 and 33 and connected to the master chiller. Refer to Sensors section, page 29, for wiring. The CCN communication bus must be connected between the two chillers. Connections can be made to the CCN screw terminals on LVT. Refer to Carrier Comfort Network® Interface section, page 28, for wiring information. Configuration examples are shown in Tables 22 and 23.
*Depending on piping sizes, use either:
• HH79NZ014 sensor/10HB50106801 well (3-in. sensor/well)
• HH79NZ029 sensor/10HB50106802 well (4-in. sensor/well)

Fig. 32 — Dual Chiller Thermistor Location

PART NUMBER	DIMENSIONS IN. (MM)	
	A	B
10HB50106801	3.10 (78.7)	1.55 (39.4)
10HB50106802	4.10 (104.1)	1.28 (32.5)
Fig. 33 — Dual Leaving Water Thermistor Well

Refer to Tables 22 and 23 for dual chiller configuration. In this example the master chiller will be configured at address 1 and the slave chiller at address 2. The master and slave chillers must reside on the same CCN bus (*Configuration→CCN →CCNB*) but cannot have the same CCN address (*Configuration→CCN→ CCNA*). Both master and slave chillers must have Lead/Lag Chiller Enable (*Configuration→RSET →LLEN*) configured to ENBL. Master/Slave Select (*Configuration→RSET→MSSL*) must be configured to MAST for the master chiller and SLVE for the slave. Also in this example, the master chiller will be configured to use Lead/Lag Balance Select (*Configuration→RSET→LLBL*) and Lead/Lag Balance Delta (*Configuration→RSET→LLBD*) to even out the chiller run-times weekly. The Lag Start Delay (*Configuration→RSET→LLDY*) feature will be set to 10 minutes. This will prevent the lag chiller from starting until the lead chiller has been at 100% capacity for the length of the delay time. Parallel configuration (*Configuration→RSET→PARA*) can only be configured to YES. The variables *LLBL*, *LLBD*, and *LLDY* are not used by the slave chiller.

Dual chiller start/stop control is determined by configuration of Control Method (*Configuration→OPT1→CTRL*) of the Master chiller. The Slave chiller should always be configured for *CTRL=0* (Switch). If the chillers are to be controlled by Remote Controls, both Master and Slave chillers should be enabled together. Two separate relays or one relay with two sets of contacts may control the chillers. The Enable/Off/Remote Control switch should be in the Remote Control position on both the Master and Slave chillers. The Enable/Off/Remote Control switch should be in the Enable position for *CTRL=2* (Occupancy) or *CTRL=3* (CCN Control).

Both chillers will stop if the Master chiller Enable/Off/Remote Control switch is in the Off position. If the Emergency Stop switch is turned off or an alarm is generated on the Master chiller the Slave chiller will operate in a Stand-Alone mode. If the Emergency Stop switch is turned off or an alarm is generated on the Slave chiller the Master chiller will operate in a Stand-Alone mode.

The master chiller controls the slave chiller by changing its Control Mode (*Run Status→VIEW→STAT*) and its operating setpoint or Control Point (*Run Status→VIEW→CT.PT*).

Temperature Reset
The control system is capable of handling leaving-fluid temperature reset based on return cooler fluid temperature. Because change in temperature through the cooler is a measure of the building load, the return temperature reset is in effect an average building load reset method. The control system is also capable of temperature reset based on outdoor-air temperature (OAT), on space temperature (SPT), or from an externally powered 4 to 20 mA signal. Accessory sensors must be used for SPT reset (33ZCT55SPT). The energy management module (EMM) must be used for temperature reset using a 4 to 20 mA signal. See Table 24.

IMPORTANT: Care should be taken when interfacing with other control systems due to possible power supply differences: full wave bridge versus half wave rectification. Connection of control devices with different power supplies may result in permanent damage. *Comfort*Link controls incorporate power supplies with half wave rectification. A signal isolation device should be utilized if the signal generator incorporates a full wave bridge rectifier.

NOTES:
1. Slave Control Method (CTRL) must be configured for 0.
2. Slave CCN Address (CCNA) must be different than Master.
3. Slave CCN Bus Number (CCNB) must be the same as Master.
4. Slave does not require SLVA, LLBL, LLBD, or LLDY to be configured.

To use outdoor air or space temperature reset, four variables must be configured. In the Configuration mode under the sub-mode RSET, items (*Configuration→RSET→CRST*), (*Configuration→RSET→RM.NO*), (*Configuration→RSET→RM.F*), and (*Configuration→RSET→RT.DG*) must be properly set. See Table 25. The outdoor air reset example provides 0°F (0°C) chilled water set point reset at 85.0°F (29.4°C) outdoor-air temperature and 15.0°F (8.3°C) reset at 55.0°F (12.8°C) outdoor-air temperature. The space temperature reset example provides 0°F (0°C) chilled water set point reset at 72.0°F (22.2°C) space temperature and 6.0°F (3.3°C) reset at 68.0°F (20.0°C) space temperature. The variable *CRST* should be configured for the type of reset desired. The variable *RM.NO* should be set to the temperature that no reset should occur. The variable *RM.F* should be set to the temperature that maximum reset is to occur. The variable *RM.DG* should be set to the maximum amount of reset desired.

To use return reset, four variables must be configured. In the Configuration mode under the sub-mode *RSET*, items *CRST*, *RT.NO*, *RT.F* and *RT.DG* must be properly set. See Table 26. This example provides 5.0°F (2.8°C) chilled water set point reset at 2.0°F (1.1°C) cooler ΔT and 0°F (0°C) reset at 10.0°F (5.6°C) cooler ΔT. The variable *RT.NO* should be set to the cooler temperature difference (ΔT) where no chilled water temperature reset should occur. The variable *RT.F* should be set to the cooler temperature difference where the maximum chilled water temperature reset should occur. The variable *RM.DG* should be set to the maximum amount of reset desired.

To verify that reset is functioning correctly proceed to Run Status mode, sub-mode VIEW, and subtract the active set point (*Run Status→VIEW→SETP*) from the control point (*Run Status→VIEW→CTPT*) to determine the degrees reset. Figures 34-36 are examples of space, outdoor air, and water temperature resets.

Table 24 — 4 to 20 mA Reset

SUB-MODE	KEYPAD ENTRY	ITEM	DISPLAY	ITEM EXPANSION	COMMENT

Fig. 35 — Outdoor-Air Temperature Reset
Fig. 36 — Standard Chilled Fluid Temperature Control — No Reset

LEGEND
EWT — Entering Water (Fluid) Temperature
LWT — Leaving Water (Fluid) Temperature

Under normal operation, the chiller will maintain a constant leaving fluid temperature approximately equal to the chilled fluid set point. As the cooler load varies, the entering cooler fluid will change in proportion to the load as shown in Fig. 36. Usually the chiller size and leaving-fluid temperature set point are selected based on a full-load condition. At part load, the fluid temperature set point may be colder than required. If the leaving fluid temperature was allowed to increase at part load, the efficiency of the machine would increase.

Return temperature reset allows for the leaving temperature set point to be reset upward as a function of the return fluid temperature or, in effect, the building load (see Fig. 37).
Fig. 37 — Reset Amount

Demand Limit

Demand limit is a feature that allows the unit capacity to be limited during periods of peak energy usage. There are 3 types of demand limiting that can be configured. The first type is through 2-stage switch control, which will reduce the maximum capacity to 2 user-configurable percentages. The second type is by 4 to 20 mA signal input which will reduce the maximum capacity linearly between 100% at a 4 mA input signal (no reduction) down to the user-configurable level at a 20 mA input signal. The third type uses the CCN Loadshed module and has the ability to limit the current operating capacity to maximum and further reduce the capacity if required.

NOTE: The 2-stage switch control and 4 to 20 mA input signal types of demand limiting require the energy management module (EMM).

To use demand limit, select the type of demand limiting to use. Then configure the demand limit set points based on the type selected.

DEMAND LIMIT (2-STAGE SWITCH CONTROLLED)

To configure demand limit for 2-stage switch control set the Demand Limit Select (*Configuration→RSET→DMDC*) to 1. Then configure the 2 Demand Limit Switch points (*Configuration→RSET→DLS1*) and (*Configuration→RSET →DLS2*) to the desired capacity limit. See Table 27. Capacity steps are controlled by 2 relay switch inputs field wired to LVT as shown in Fig. 6-19.

For demand limit by 2-stage switch control, closing the first stage demand limit contact will put the unit on the first demand limit level. The unit will not exceed the percentage of capacity entered as Demand Limit Switch 1 set point (*DLS1*). Closing contacts on the second demand limit switch prevents the unit from exceeding the capacity entered as Demand Limit Switch 2 set point. The demand limit stage that is set to the lowest demand takes priority if both demand limit inputs are closed. If the demand limit percentage does not match unit staging, the unit will limit capacity to the closest capacity stage.

To disable demand limit configure *DMDC* to 0. See Table 27.

EXTERNALLY POWERED DEMAND LIMIT (4 TO 20 MA CONTROLLED)

To configure demand limit for 4 to 20 mA control set the Demand Limit Select (*Configuration→RSET →DMDC*) to 2. Then configure the Demand Limit at 20 mA (*Configuration→RSET→DM20*) to the maximum loadshed value desired. Connect the output from an externally powered 4 to 20 mA signal to terminal block LVT-7,8. Refer to the unit wiring diagram for these connections to the optional/accessory energy management module and terminal block. The control will reduce allowable capacity to this level for the 20 mA signal. See Fig. 38 and Table 27.

⚠ CAUTION

Care should be taken when interfacing with other manufacturer's control systems, due to possible power supply differences, full wave bridge versus half wave rectification. The two different power supplies cannot be mixed. *Comfort*Link controls use half wave rectification. A signal isolation device should be utilized if a full wave bridge signal generating device is used.

DEMAND LIMIT (CCN LOADSHED CONTROLLED)

To configure Demand Limit for CCN Loadshed control set the Demand Limit Select (*Configuration→RSET→DMDC*) to 3. Then configure the Loadshed Group Number (*Configuration→RSET→SHNM*), Loadshed Demand Delta (*Configuration→RSET→SHDL*), and Maximum Loadshed Time (*Configuration→RSET→SHTM*). See Table 27.

The Loadshed Group number is established by the CCN system designer. The *Comfort*Link controls will respond to a Redline command from the Loadshed control. When the Redline command is received, the current stage of capacity is set to the maximum stages available. Should the loadshed control send a Loadshed command, the *Comfort*Link controls will reduce the current stages by the value entered for Loadshed Demand delta. The Maximum Loadshed Time is the maximum length of time that a loadshed condition is allowed to exist. The control will disable the Redline/Loadshed command if no Cancel command has been received within the configured maximum loadshed time limit.

Digital Scroll Option

The 30RAP010-090 units have a factory-installed option for a digital scroll compressor which provides additional stages of unloading for the unit. The digital compressor is always installed in the

A1 compressor location. When a digital compressor is installed, a digital unloader solenoid (DUS) is used on the digital compressor.

DIGITAL SCROLL OPERATION

A digital scroll operates in two stages — the "loaded state" when the solenoid valve is deenergized and the "unloaded state" when the solenoid valve is energized. During the loaded state, the compressor operates like a standard scroll and delivers full capacity and mass flow.

However, during the unloaded state, there is no capacity and no mass flow through the compressor. The capacity of the system is varied by varying the time the compressor operates in an unloaded and loaded state during a 15-second period. If the DUS is energized for 7 seconds, the compressor will be operating at 47% capacity. If the DUS is energized for 10 seconds, the compressor will be operating at approximately 33% of its capacity. Capacity is the time averaged summation of loaded and unloaded states, and its range is continuous from the minimum configured capacity to 100%. Regardless of capacity, the compressor always rotates with constant speed. As the compressor transitions from a loaded to unloaded state, the discharge and suction pressures will fluctuate and the compressor sound will change.

The *Comfort*Link controller controls and integrates the operation of the DUS into the compressor staging routine to maintain temperature control. When a digital compressor is installed, an additional discharge gas temperature thermistor (DTT) is installed along with the AUX board for control of the DUS.

DIGITAL COMPRESSOR CONFIGURATION

When a digital compressor is installed, the configuration parameter (***Configuration→UNIT→A1.TY***) is configured to YES. There is also a maximum unload time configuration (***Configuration→UNIT→MAX.T***) that is set to 7 seconds, which indicates the maximum unloading for the digital compressor is 47%. This is done to optimize efficiency of the system.

Fig. 38 — 4 to 20-mA Demand Limiting

PRE-START-UP

IMPORTANT: Before beginning Pre-Start-Up or Start-Up, complete Start-Up Checklist for 30RAP Liquid Chiller at end of this publication (pages CL-1 to CL-12). The checklist assures proper start-up of a unit, and provides a record of unit condition, application requirements, system information, and operation at initial start-up.

Do not attempt to start the chiller until the following checks have been completed.

System Check

1. Check all auxiliary components, such as chilled fluid pumps, air-handling equipment, or other equipment to which the chiller supplies liquid. Consult manufacturer's instructions. Verify that any pump interlock contacts have been properly installed. If the unit has field-installed accessories, be sure all are properly installed and wired correctly. Refer to unit wiring diagrams.
2. Use the scrolling marquee display to adjust the Cooling Set Point.
3. Fill chilled fluid circuit with clean water (with recommended inhibitor added) or other non-corrosive fluid to be cooled. Bleed all air out of the high points of the system. If chilled water is to be maintained at a temperature below 40°F (4.4°C) or outdoor temperatures are expected to be below 32°F (0°C), an antifreeze of sufficient concentration must be used to prevent freeze-up at anticipated suction temperatures.

   The chilled water loop must be cleaned before the unit is connected.

   NOTE: On units with digital scroll option do not check refrigerant charge if compressor is operating at less than 100% capacity, digital operation can be disabled by configuring *A1.TY = NO (Configuration→UNIT→A1.TY)*
4. Check tightness of all electrical connections.
5. Oil should be visible in the compressor sight glass(es). See Fig. 39. For unit sizes 010-090, an acceptable oil level is from $^1/_8$ to $^3/_8$ of sight glass. For unit sizes 100-150, an acceptable oil level is from $^3/_4$ to $^7/_8$ of sight glass. No oil should be removed unless the crankcase heater, if equipped, has been energized for at least 24 hours. Adjust the oil level as required. See Oil Charge section on page 60 for Carrier approved oils.
6. Electrical power source must agree with unit nameplate.
7. All condenser fan and factory-installed hydronic package pump motors are phase. For non-HEVCF units, check for proper rotation of condenser fans first BEFORE attempting to start pumps or compressors. For HEVCF units, check the phase to ensure the supply power phase rotation is clockwise A-B-C (L1-L2-L3). To reverse rotation, interchange any two of the main incoming power leads.
8. Be sure system is fully charged with refrigerant (see Check Refrigerant Charge section on page 52).
9. Verify proper operation of cooler and hydronic package heaters (if installed). Heaters operate at the same voltage as the main incoming power supply and are single phase. Heater current is approximately 0.4 amps for 460 and 575 v units. Heater current is approximately 0.8 amps for 230 v units.

OIL
SIGHT GLASS
Fig. 39 — Sight Glass Location

START-UP AND OPERATION

NOTE: Refer to Start-Up Checklist on pages CL-1 to CL-12.

⚠ **CAUTION**

Crankcase heaters, if equipped, are wired into the control circuit, so they are always operable as long as the main power supply disconnect is on (closed), even if any safety device is open. Compressor heaters must be on for 24 hours prior to the start-up of any compressor. Equipment damage could result if heaters are not energized for at least 24 hours prior to compressor start-up.

51

Crankcase Heaters

Unit sizes 070-150 are equipped with crankcase heaters. Unit sizes 010-060 require field-installed crankcase heater(s) if remote cooler accessory is utilized. Compressor crankcase heaters, if equipped, must be on for 24 hours before start-up. To energize the crankcase heaters, close the field disconnect and turn on the fan circuit breakers. Leave the compressor circuit breakers off/open. The crankcase heaters are now energized.

Actual Start-Up

Actual start-up should be done only under supervision of a qualified refrigeration mechanic.

1. Be sure all service valves are open.
2. Using the scrolling marquee display, set leaving-fluid set point (*Set Points→COOL→CSP.1*). No cooling range adjustment is necessary.
3. Start chilled fluid pump (if not configured for cooler pump control).
4. Turn Enable/Off/Remote Control switch to ENABLE position.
5. Allow unit to operate and confirm that everything is functioning properly. Check to see that leaving fluid temperature agrees with leaving set point (*Set Points→COOL →CSP.1*) or (*Set Points→COOL→CSP.2*), or if reset is used, with the control point (*Run Status→VIEW →CTPT*).
6. Check the cooler leaving chilled water temperature to see that it remains well above 32°F (0°C), or the brine freezing point if the unit is a medium temperature brine unit.
7. Recheck compressor oil level (see Oil Charge section).

Check Refrigerant Charge

All 30RAP units are shipped with a complete operating charge of R-410A and should be under sufficient pressure to conduct a leak test after installation. If there is no system pressure, admit nitrogen until a pressure is observed and then proceed to test for leaks. After leaks are repaired, the system must be dehydrated.

All refrigerant charging should be done through the 1/4 in. Schrader connection on the liquid line. Do NOT add refrigerant charge through the low-pressure side of the system. If complete charging is required, weigh in the appropriate charge for the circuit as shown on the unit nameplate. If partial charging is required, operate circuit at full load and use an accurate temperature sensor on the liquid line as it enters the filter drier. Use the Temperatures mode on the scrolling marquee display to show the circuit saturated condensing temperature (*Temperatures→CIR.A→SCT.A*) or (*Temperatures→CIR.B→ SCT.B*). Charging is most accurate at saturated discharge temperatures of 120 to 125°F (49 to 52°C). Block condenser airflow as required to reach this temperature range. Add refrigerant until the system subcooling (*SCT.A* or *SCT.B* minus liquid line temperature entering EXV) is

approximately 15 to 17°F (–9.4 to –8.3°C). Refrigerant VAPOR only may be added to a circuit through the 1/4 in. suction Schrader connection on the suction line.

Charge Adjustment for Brine Operation

For 30RAP010-060 units, the 30RAP chiller does not require a medium temperature brine modification at any temperature within the chiller application range which is as low as 14°F (–10°C) leaving fluid temperature.

For 30RAP070-150 units with MCHX condenser, see Table 28 for proper charge adjustment. For 30RAP070-150 units with RTPF condenser, no charge adjustment is needed.

⚠ **CAUTION**

Never charge liquid into low-pressure side of system. Do not overcharge. Overcharging results in higher discharge pressure, possible compressor damage, and higher power consumption. During charging or removal of refrigerant, be sure water is continuously circulating through the cooler to prevent freezing.

Operating Limitations

COOLER FLOW RATES AND LOOP VOLUMES

Refer to Table 29 for minimum and maximum cooler flow rates, and to Table 30 for minimum fluid volume requirements.

TEMPERATURES (See Table 31 for 30RAP standard temperature limits.)

⚠ **CAUTION**

Do not operate with cooler leaving chiller water (fluid) temperature (LCWT) below 40°F (4.4°C) without an appropriate concentration of an inhibited antifreeze solution. Units should not be operated below 15°F (–9.4°C) when configured for medium temperature brine. Damage to the cooler and/or compressor(s) may result.

High Cooler Leaving Chilled Water (Fluid) Temperatures (LCWT)

During start-up with cooler LCWT above approximately 60°F (16°C), the unit expansion valve will limit suction pressure to approximately 142 psig (929 kPa) to avoid overloading the compressor.

Low Cooler LCWT

For standard units, the LCWT must be no lower than 40°F (4.4°C). If the unit is the factory-installed optional medium temperature brine unit, the cooler LCWT can go down to 15°F (–9.4°C).

LEGEND

EWT — Entering Fluid (Water) Temperature
LWT — Leaving Fluid (Water) Temperature

*For sustained operation, EWT should not exceed 85 F (29.4 C).

LOW-AMBIENT OPERATION

If operating temperatures below 45°F (7°C) on size 018-030 units, and 32°F (0°C) on size 035-150 units are expected, accessory Motormaster® V control must be installed. Operating temperatures can go as low as –20°F (–29°C) on size 010-016 units, as standard, and all Greenspeed® units. Installation of wind baffles is also required. Refer to separate installation instructions for operation using this accessory. Contact your Carrier representative for details.

> ⚠ **CAUTION**
>
> Brine duty application (below 40°F [4.4°C] LCWT) requires an appropriate concentration of an inhibited antifreeze solution and may require low ambient head pressure control and wind baffles for proper operation. Contact your Carrier representative for additional information for the specific application.

VOLTAGE — ALL UNITS

Main Power Supply

Minimum and maximum acceptable supply voltages are listed in the Installation Instructions.

Unbalanced 3-Phase Supply Voltage — Never operate a motor where a phase imbalance between phases is greater than 2%. To determine percent voltage imbalance:

$$\% \text{ Voltage Imbalance} = 100 \times \frac{\text{max voltage deviation from avg voltage}}{\text{average voltage}}$$

The maximum voltage deviation is the largest difference between a voltage measurement across 2 legs and the average across all 3 legs.

Example: Supply voltage is 240-3-60.

AB = 243 v
BC = 236 v
AC = 238 v
1. Determine average voltage:

$$\text{Average voltage} = \frac{243 + 236 + 238}{3}$$

$$= \frac{717}{3}$$

$$= 239$$

2. Determine maximum deviation from average voltage:
   (AB) 243 − 239 = 4 v
   (BC) 239 − 236 = 3 v
   (AC) 239 − 238 = 1 v
   Maximum deviation is 4 v.

3. Determine percent voltage imbalance:

$$\% \text{ Voltage Imbalance} = 100 \text{ x } \frac{4}{239}$$

$$= 1.7\%$$

This voltage imbalance is satisfactory as it is below the maximum allowable of 2%.

> IMPORTANT: If the supply voltage phase imbalance is more than 2%, contact your local electric utility company immediately. Do not operate unit until imbalance condition is corrected.

Control Circuit Power

Power for the control circuit is supplied from the main incoming power through a factory-installed control power transformer (TRAN1) for all models. Field wiring connections are made to the LVT.

OPERATION SEQUENCE

During unit off cycle, the control monitors the outdoor air temperature. If the ambient temperature drops below 40°F (4.4°C), cooler and hydronic system heaters (if either are factory installed) are energized.

The unit is started by putting the Enable/Off/Remote Control switch in the ENABLE or Remote Control position. When the unit receives a call for cooling (either from the internal control or CCN network command or Remote Control closure), the unit stages up in capacity to maintain the leaving fluid set point. The first compressor starts 1-1/2 to 3 minutes after the call for cooling.

The lead circuit can be specifically designated on all models or selected based on compressor run hours and starts depending on field configuration. The unit control will override this selection under certain starting conditions to properly maintain oil return to the compressors. In general, on dual compressor circuits, the control will most often start the A1 or B1 compressor first, especially after long off periods. The MBB controls fan stages to maintain the head pressure set point and will automatically adjust unit capacity as required to keep compressors from operating outside of the specified envelope. There are no pumpout or pumpdown sequences on these chillers.

For all units, if temperature reset is being used, the unit controls to a higher leaving-fluid temperature as the building load reduces. If demand limit is used, the unit may temporarily be unable to maintain the desired leaving-fluid temperature because of imposed power limitations.

SERVICE

> **⚠ WARNING**
>
> Electrical shock can cause personal injury and death. Shut off all power to this equipment during service. There may be more than one disconnect switch. Tag all disconnect locations to alert others not to restore power until work is completed.

Electronic Components

CONTROL COMPONENTS

Unit uses an advanced electronic control system that normally does not require service.

Access to the compressors is through latched panels from beneath the control box on all models or from opposite the coil side (sizes 010-030 only). The front door(s) provide access to the compressor(s) and all components of the refrigeration system. For size 010-030 units, access to the controls is through the upper latched outer door above the compressor access door. Similarly, the upper center latched door on sizes 035-150 gives access to the controls. Inner panels are secured in place and should not be removed unless all power to the chiller is off.

Electronic Expansion Valve (EXV)

See Fig. 40 for a cutaway view of the EXV. High-pressure liquid refrigerant enters valve through the top. As refrigerant passes through the orifice, pressure drops and refrigerant changes to a 2-phase condition (liquid and vapor). The electronic expansion valve operates through an electronically controlled activation of a stepper motor. The stepper motor stays in position, unless power pulses initiate the two discrete sets of motor stator windings for rotation in either direction. The direction depends on the phase relationship of the power pulses.

As the stepper motor rotates, its motion is transferred to linear movement by a lead screw. Refrigerant flow is modulated by either opening or closing the port. The valve includes a positive shut-off when closed.

6. Lead Screw
7. Insert
8. Valve Piston
9. Valve Seat
10. Valve Port
Fig. 40 — Cutaway View of the Electronic Expansion Valve (Size 070-150 Shown)

There are four different EXVs. Table 32 shows the number of steps, by unit size, for each type of EXV. The EXV motor moves at 200 or 150 steps per second, respectively, for sizes 010-060 or sizes 070-150. Commanding the valve to either 0% or 100% will add extra steps to the move, to ensure the value is open or closed completely.

Table 32 — EXV Steps

UNIT SIZE 30RAP	EXV STEPS
010-020	1596
025,030	2500
035-045	1596
050-060	2500
070-090, 100 CKT A	2785
100 CKT B, 110-150	3690

The EXV board controls the valve. Each circuit has a thermistor located in a well in the suction manifold before the compressor. Suction pressure as measured by the suction pressure transducer is

converted to a saturated suction temperature. The thermistor measures the temperature of the superheated gas entering the compressor and the pressure transducer determines the saturated temperature of suction gas. The difference between the temperature of the superheated gas and the saturated suction temperature is the superheat. The EXV board controls the position of the electronic expansion valve stepper motor to maintain superheat set point.

The MBB controls the superheat leaving cooler to approximately 9°F (5°C). Because EXV status is communicated to the main base board (MBB) and is controlled by the EXV boards, it is possible to track the valve position. The unit is then protected against loss of charge and a faulty valve. Just prior to compressor start, the EXV will open. At low ambient temperatures the EXV is closed at start-up. After initialization period, valve position is tracked by the EXV board by constantly monitoring the amount of valve movement.

The EXV is also used to limit cooler saturated suction temperature to 50°F (10°C). This makes it possible for the chiller to start at higher cooler fluid temperatures without overloading the compressor. This is commonly referred to as MOP (maximum operating pressure). At ambient temperatures above 110°F (43°C), MOP is bypassed at start-up to prevent charge backup in the condenser.
If it appears that the EXV module is not properly controlling circuit operation to maintain correct superheat, there are a number of checks that can be made using test functions and initialization features built into the microprocessor control. See the EXV Troubleshooting Procedure section to test EXVs.
EXV Troubleshooting Procedure

Follow steps below to diagnose and correct EXV problems.

Check EXV motor operation first. Switch the Enable/Off/Remote Control (EOR) switch to the Off position. Press ESCAPE on the scrolling marquee until the display is blank or on Navigator™ display until "Select a menu item" appears on the display. Use the arrow keys to select the Service Test mode. Press ENTER. The display will be:

> TEST   OFF

           OUTS

           COMP

Press ENTER (password entry may be required) and use ▲ to change "OFF" to "ON". Switch the EOR switch to Enable. The Service Test mode is now enabled. Move the pointer down to the OUTS sub-mode and press ENTER. Move the pointer to item *EXV.A* or *EXV.B* as needed. Press ENTER and the valve position will flash. Use ▲ to select 100% valve position (hold ▲ for quick movement) and press ENTER.

The technician should be able to feel the actuator moving by placing a hand on the *EXV. A* sight glass is located on the valve body to verify that the actuator is moving. A hard knocking should be felt from the actuator when it reaches the top of its stroke (can be heard if surroundings are relatively quiet). Press ENTER again twice if necessary to confirm this. To close the valve, press ENTER, select 0% with ▼ and press ENTER. The actuator should knock when it reaches the bottom of its stroke. If it is believed that the valve is not working properly, continue with the checkout procedure below.

Check the EXV output signals at appropriate terminals on the EXV board (see Fig. 41 or 42). Do not disconnect EXV connector with power applied to the board. Damage to the board may result if disconnected while under power. Connect positive test lead to EXV-J6 terminal 3 for Circuit A, EXV-J7 terminal 3 for Circuit B. Set meter to approximately 20 vdc. Using the Service Test procedure above, move the valve output under test to 100%. DO NOT short meter leads together or pin 3 to any other pin as board damage will occur.

> ⚠ **CAUTION**

Do not disconnect EXV connector with power applied to the board. Damage to the board may result if disconnected while under power. DO NOT short meter leads together or pin 3 to any other pin as board damage will occur.

During the next several seconds, carefully connect the negative test lead to pins 1,2,4 and 5 in succession (plug J6 for Circuit A, plug J7 for Circuit B). Digital voltmeters will average this signal and display approximately 6 vdc. If it remains constant at a voltage other than 6 vdc or shows 0 volts, remove the connector to the valve and recheck.

Press ENTER and select 0% to close the valve. Check the 4-position DIP switch on the board (all switches should be set to On). If a problem still exists, replace the EXV board. If the reading is correct, the expansion valve and EXV wiring should be checked.

1. Check color coding and wire connections. Make sure they are connected to the correct terminals at the EXV board and EXV plug and that the cables are not crossed.

2. Check for continuity and tight connection at all pin terminals.

3. If the motor fails to operate properly, check the resistance of each motor phase. Remove the EXV Board connector (J6 for Circuit A, J7 for Circuit B). Check the resistance of the two windings. Resistance between pins 1 and 2 for one winding or between pins 4 and 5 for the other winding should be approximately 100 ± 10 ohms (sizes 010-060) or 52 ± 5.2 ohms (sizes 070-150). Differences of more than 10% between windings indicate a defective motor. Resistance between any lead and ground should be infinite or "open." Any resistance reading will indicate a shorted winding and the valve will need to be replaced.

FIELD SERVICING INSTRUCTIONS

EXVs on sizes 025, 030, and 050-150 can be serviced. See Fig. 40 for a cutaway view of the EXV for sizes 070-150. Motor kits for the EXVs on sizes 025, 030, and 050-150 are available as replacement parts. The EXVs on sizes 010-020 and 035-045 are hermetic and cannot be disassembled for installation or during service.

EXV REPLACEMENT (ALL SIZES)

To replace the valve, perform the following procedure:

1. Be sure the refrigerant has been recovered from the circuit.
2. Disconnect the EXV cable from the EXV. For sizes 010-060, refer to Fig. 41 or 42 and remove the EXV retainer clip, taking care not to damage the clip as it will be required for installation later.
3. The valve may be replaced by cutting the piping. A tubing cutter must be used to prevent creating contaminants in the piping.
4. The EXVs have copper connections and any brazing alloy can be used to install the valve. During installation the torch flame should be directed away from the valve body and cable. The valve body should be wrapped with a wet cloth during the brazing operation. Be sure to use a nitrogen purge while brazing the valve in place.
5. Check for refrigerant leaks.
6. Once the valve body has cooled, reconnect the EXV cable. Care should be taken to ensure engagement of the alignment key. On sizes 010-060, install the EXV cable retainer clip.
7. Check the operation of the valve using the EXV Troubleshooting Procedure on page 55.
Fig. 41 — 30RAP010-060 EXV Cable Connections to EXV Module
Fig. 42 — 30RAP070-150 EXV Cable Connections to EXV Module

VALVE MOTOR REPLACEMENT

Sizes 025, 030, and 050-060

IMPORTANT: Obtain replacement gasket before opening EXV. Do not re-use gaskets.

Perform the following procedure to replace the EXV motor:

1. Be sure the refrigerant has been recovered from the circuit.
2. Remove power from the EXV board.
3. Refer to Fig. 43 and remove the EXV retainer clip, taking care not to damage the clip as it will be required for installation later.
4. Using a wrench and back-up wrench, remove the motor assembly from the EXV body by placing the back-up wrench on the valve body.
5. To install the motor, be sure to use a new gasket. Connect the EXV cable to the EXV motor assembly.
6. Use Service Test as described on page 40 to open the EXV to 100%. This will retract the piston fully. Remove power from the EXV board prior to removing the EXV cable. Remove the EXV cable from the motor prior to installation. For 025, 030, 050-060 sizes, replacement motors are shipped in the

retracted position and may be installed as received; therefore, this step may be skipped if installing a new motor.

⚠ **CAUTION**

If the existing motor has been removed for inspection or cleaning, be sure that the piston is fully retracted into the motor assembly before installation on the valve. Failure to do so will permanently damage the drive and motor. Replacement motor assemblies are shipped in the retracted position and may be installed as received.

7. Lightly oil the threads and gasket on the new motor. Carefully seat the motor on the valve body. Using a wrench and back-up wrench as described above, tighten the motor assembly as follows: one eighth turn more than hand tight is sufficient to achieve a leak proof seal.
8. After the motor is tightened, the cable should be replaced on the valve. Care should be taken to ensure engagement of the alignment key. Install the EXV cable retainer clip (see Fig. 43).
9. Pressurize the system and check for leaks.
10. Reapply control power and test the operation using Service Test.

Sizes 070-150

IMPORTANT: Obtain replacement gasket before opening EXV. Do not re-use gaskets.

Perform the following procedure to replace the EXV motor:

1. Be sure the refrigerant has been recovered from the circuit.
2. On sizes 070-150, use Service Test as described on page 40 to open the EXV to 100%. This will retract the piston fully.
3. Remove power from the EXV board and then disconnect the EXV cable from the EXV.
4. Using a wrench and back-up wrench, remove the motor assembly from the EXV body. Be sure to place the back-up wrench on the adapter to remove the motor as shown in Fig. 44.
5. To install the motor, be sure to use a new gasket.
6. Manually depress the valve piston before installing the motor assembly. This will allow for the lead screw to engage the piston as the motor is installed.
7. Lightly oil the threads and gasket on the new motor. Carefully seat the motor on the valve body. Using a wrench and back-up wrench as described above, tighten the motor assembly as follows: Tighten the motor to 36 ft-lb (50 N•m) and then tighten an additional 30 degrees as indicated in Fig. 44.
8. After tightening the motor, replace the cable on the valve. Care should be taken to ensure engagement of the alignment key. Pressurize the system and check for leaks.
9. Reapply control power and test the operation using Service Test.
Fig. 43 — Electronic Expansion Valve Details (010-060)
NOTE: Open valve in Quick Test sub-mode before disassembling.
NOTES:
1. Push down on valve piston to close valve before assembling.
2. After valve is assembled close valve in Quick Test sub-mode or cycle power before opening service valve.

Fig. 44 — Disassembly and Assembly of EXV Motor (070-150)

Compressor Replacement (Fig. 45-47)

All models contain scroll compressors and have from one to six compressors. The size 010-030 units are a single refrigeration circuit while sizes 035-150 are dual circuit. Disconnect power to unit using lockout tagout procedures.

Remove the junction box cover bolts (Danfoss compressors only) and disconnect the compressor power and ground connections. Remove the cable from the compressor junction box. Knock the

same holes out of the new compressor junction box and install the cable connectors from the old compressor.

The compressors are bolted to rails, which are in turn bolted to the unit basepan for all sizes except 010 and 015 which are directly bolted to the basepan. Remove the 4 bolts holding the compressor to the rail on the basepan. Save the mounting hardware for use with the new compressor. Carefully cut the compressor suction and discharge lines with a tubing cutter as close to the compressor

as feasible. Remove high-pressure switch and pressure transducer(s) if required for compressor removal. Lift one corner of the compressor at a time and remove all the rubber mounting grommets (single compressor circuits) or steel spacers (dual compressor circuits). Remove the old compressor from the unit.

Slide the new compressor in place on the basepan. Lifting one side of the compressor at a time, replace all of the compressor mounting grommets. Using new tubing as required, reconnect compressor suction and discharge lines. Using hardware saved, reinstall

the mounting bolts and washers through the compressor feet. Using proper techniques, braze suction and discharge lines and check for leaks. Reconnect oil equalization line on dual compressor circuit models.

Reconnect the compressor power connections and high-pressure switch wiring as on the old compressor. Refer to Fig. 45-47. Following the installation of the new compressor, tighten all hardware to the following specifications. (See Table 33.)

Crankcase Heater

The 30RAP070-150 units are equipped with crankcase heaters. 30RAP070-090 units utilize a 90-watt heater on each compressor. See Fig. 48. 30RAP100-150 units utilize a 56-watt heater secured to the bottom of each compressor (see Fig. 49). The 30RAP010-060 units are not equipped with crankcase heaters because the system refrigerant charge is less than the compressor manufacturer's requirement.

Crankcase heaters are required on all units installed with remote coolers. Refer to remote cooler installation instructions for more information.

Cooler

BRAZED-PLATE COOLER HEAT EXCHANGER RE-
PLACEMENT

Brazed-plate heat exchangers cannot be repaired if they develop a leak. If a leak (refrigerant or water) develops, the heat exchanger **must be** replaced. To replace a brazed-plate heat exchanger:

1. Check that the replacement heat exchanger is the same as the original heat exchanger. The unit insulation covers the manufacturer's part number. Make sure the depths of the replacement and original cooler heat exchangers are the same.
2. Disconnect the liquid-in and liquid-out connections at the heat exchanger.
3. Recover the refrigerant from the system, and unsolder the refrigerant-in and refrigerant-out connections.
4. Remove the old heat exchanger. Save the mounting hardware for use with the replacement heat exchanger. The replacement heat exchanger is supplied fully insulated. It also includes a cooler heater. Use of the heater is not required unless the original cooler contained a factory-installed heater.
5. Install the replacement heat exchanger in the unit and attach the mounting bracket hardware to the fan uprights (sizes 010-030) or to the bottom bracket (sizes 035-150) using the hardware removed in Step 4. Reconnect the cooler heater if required. For sizes 010-025, torque the bolts to 7 to 10 ft-lb (9.5 to 13.5 N•m). For sizes 030-150, torque the bolts to 30 to 50 ft-lb (40.6 to 67.7 N•m).
6. *Carefully* braze the refrigerant lines to the connections on the heat exchanger. Lines should be soldered using silver as the soldering material with a minimum of 45% silver. Keep the temperature below 1472°F (800°C) under normal soldering conditions (no vacuum) to prevent the copper solder of the brazed plate heat exchanger from changing its structure. Failure to do so can result in internal or external leakage at the connections which cannot be repaired. Braze the liquid lines with a heat sink around the expansion valve to protect it from excess heat.
7. Reconnect the water/brine lines.
8. Dehydrate and recharge the unit. Check for leaks.

BRAZED-PLATE COOLER HEAT EXCHANGER CLEAN-
ING

Brazed-plate heat exchangers must be cleaned chemically. A professional cleaning service skilled in chemical cleaning should be used. Use a weak acid (5% phosphoric acid, or if the heat exchanger is cleaned frequently, 5% oxalic acid). Pump the cleaning solution through the exchanger, preferably in a backflush mode. After cleaning, rinse with large amounts of fresh water to dispose of all the acid. Cleaning materials must be disposed of properly.

The factory-installed strainer screen in front of the water/brine inlets of the heat exchangers should be cleaned periodically, depending on condition of the chiller water/brine.

Oil Charge

> ⚠ **CAUTION**
>
> The compressor in a Puron® refrigerant (R-410A) system uses a polyolester (POE) oil. This is extremely hygroscopic, meaning it absorbs water readily. POE oils can absorb 15 times as much water as other oils designed for HCFC and CFC refrigerants. Take all necessary precautions to avoid exposure of the oil to the atmosphere. Failure to do so could result in possible equipment damage.

Puron refrigerant systems use a polyolester (POE) oil. Use only Carrier-approved compressor oil. Oil should be visible in compressor oil sight glass. An acceptable oil level is from $1/8$ to $3/8$ of sight glass for unit size 010-090, and $3/4$ to $7/8$ of sight glass for unit size 100-150. All compressors must be off when checking oil level. Recommended oil level adjustment method is as follows:

ADD OIL

Recover charge from the unit. Add oil to suction line Schrader valve on tandem compressors sets and the compressor Schrader on the three-compressor circuits and single-compressor circuits. (See Fig. 45-47.) When oil can be seen at the bottom of the sight glass, add oil in 5 oz increments which is approximately 1/8 of oil level. Run all compressors for 20 minutes then shut off to check oil level. Repeat procedure until acceptable oil level is present.

NOTE: Use only Carrier-approved compressor oil.

• Oil Type . . . . Inhibited polyolester-based synthetic compressor lubricant.

• ISO Viscosity Grade 32

Approved sources are:

UNIT SIZES 010-090

MANUFACTURER	OIL
Totaline	3MAF POE, P903-1601
Mobil	EAL Arctic 32-3MA
Uniqema (ICI)	Emkarate RL32-3MAF

UNIT SIZES 100-150

MANUFACTURER	OIL
Totaline	P903-2401
Uniqema (ICI)	Emkarate RL 32H

Do not reuse drained oil or any oil that has been exposed to the atmosphere.

Microchannel Heat Exchanger Condenser Coil Maintenance and Cleaning Recommendations

⚠️ **CAUTION**

Do not apply any chemical cleaners to MCHX condenser coils. These cleaners can accelerate corrosion and damage the coil.

Routine cleaning of coil surfaces is essential to maintain proper operation of the unit. Elimination of contamination and removal of harmful residues will greatly increase the life of the coil and extend the life of the unit. The following steps should be taken to clean MCHX condenser coils:

1. Remove any foreign objects or debris attached to the coil face or trapped within the mounting frame and brackets.
2. Put on personal protective equipment including safety glasses and/or face shield, waterproof clothing, and gloves. It is recommended to use full coverage clothing.
3. Start high pressure water sprayer and purge any soap or industrial cleaners from sprayer before cleaning condenser coils. Only clean, potable water is authorized for cleaning condenser coils.
4. Clean condenser face by spraying the coil steadily and uniformly from top to bottom while directing the spray straight toward the coil. Do not exceed 900 psig or 30 degree angle. The nozzle must be at least 12 in. from the coil face. Reduce pressure and use caution to prevent damage to air centers.

Round Tube Plate Fin (RTPF) Condenser Coil Maintenance and Cleaning Recommendations

Routine cleaning of coil surfaces is essential to maintain proper operation of the unit. Elimination of contamination and removal of harmful residues will greatly increase the life of the coil and extend the life of the unit. The following maintenance and cleaning procedures are recommended as part of the routine maintenance activities to extend the life of the coil.

REMOVE SURFACE LOADED FIBERS

Surface loaded fibers or dirt should be removed with a vacuum cleaner. If a vacuum cleaner is not available, a soft non-metallic bristle brush may be used. In either case, the tool should be applied in the direction of the fins. Coil surfaces can be easily damaged (fin edges can be easily bent over and damage to the coating of a protected coil) if the tool is applied across the fins.

NOTE: Use of a water stream, such as a garden hose, against a surface loaded coil will drive the fibers and dirt into the coil. This will make cleaning efforts more difficult. Surface loaded fibers must be completely removed prior to using low velocity clean water rinse.

PERIODIC CLEAN WATER RINSE

A periodic clean water rinse is very beneficial for coils that are applied in coastal or industrial environments. However, it is very important that the water rinse is made with very low velocity water stream to avoid damaging the fin edges. Monthly cleaning is recommended.

ROUTINE CLEANING OF COIL SURFACES

Routine cleaning with Totaline® environmentally balanced coil cleaner is essential to extend the life of coils. This cleaner is available from Carrier Replacement parts division as part number

P902-0301 for a one-gallon container, and part number P902-0305 for a 5-gallon container. It is recommended that all coils, including the standard copper tube aluminum fin, pre-coated fin, copper fin, or e-coated coils be cleaned with the Totaline environmentally balanced coil cleaner as described below. Coil cleaning should be part of the unit's regularly scheduled maintenance procedures to ensure long life of the coil. Failure to clean the coils may result in reduced durability in the environment.

Avoid the use of:
- coil brighteners
- acid cleaning prior to painting
- high pressure washers
- poor quality water for cleaning

Totaline environmentally balanced coil cleaner is non-flammable, hypoallergenic, nonbacterial, and a USDA accepted biodegradable agent that will not harm the coil or surrounding components such as electrical wiring, painted metal surfaces, or insulation. Use of non-recommended coil cleaners is strongly discouraged since coil and unit durability could be affected.

⚠️ **CAUTION**

Excessive water pressure will fracture the braze between air centers and refrigerant tubes.

Check Refrigerant Feed Components

FILTER DRIER

The function of the filter drier is to maintain a clean, dry system. The moisture indicator (described below) indicates any need to change the filter drier. The filter drier is a sealed-type drier. When the drier needs to be changed, the entire filter drier must be replaced.

NOTE: Dual circuit (035-150 sizes) units have 1 filter drier per circuit.

MOISTURE-LIQUID INDICATOR

The indicator is located immediately ahead of the EXV to provide an indication of the refrigerant moisture content. It also provides a sight glass for refrigerant liquid. Clear flow of liquid refrigerant (*at full unit loading*) indicates sufficient charge in the system. Bubbles in the sight glass (*at full unit loading*) indicate an undercharged system or the presence of noncondensables. Moisture in the system, measured in parts per million (ppm), changes the color of the indicator as follows:

Green (safe) — Moisture is below 75 ppm
Yellow-Green (caution) — 75 to 150 ppm
Yellow (wet) — above 150 ppm

The unit must be in operation at least 12 hours before the moisture indicator gives an accurate reading, and must be in contact with *liquid* refrigerant. At the first sign of moisture in the system, change the corresponding filter drier.

NOTE: Dual circuit (035-150 sizes) units have one indicator per circuit.

MINIMUM LOAD VALVE

On units equipped with the factory-installed capacity reduction option, a solenoid valve and discharge bypass valve (minimum load valve) are located between the discharge line and the cooler entering-refrigerant line. The MBB cycles the solenoid to perform minimum load valve function and the discharge bypass valve modulates to the suction pressure set point and the valve.

The amount of capacity reduction achieved by the minimum load valve is not adjustable. The total unit capacity with the minimum load valve is shown in Table 13.

PRESSURE RELIEF DEVICES

All units have one pressure relief device per circuit located in the liquid line which relieves at 210°F (100°C).

Check Unit Safeties

HIGH-PRESSURE SWITCH

A high-pressure switch is provided to protect each compressor and refrigeration system from unsafe high pressure conditions. See Table 34 for high-pressure switch settings.

The high-pressure switch is mounted in the discharge line of each circuit. If an unsafe, high-pressure condition should exist, the switch opens and shuts off the affected circuit. The CSB senses the compressor feedback signal and generates an appropriate alarm. The MBB prevents the circuit from restarting until the alert condition is reset. The switch should open at the pressure corresponding to the appropriate switch setting as shown in Table 34.

Table 34 — Factory Settings, High-Pressure Switch (Fixed)

UNIT	CUTOUT		CUT-IN	
	PSIG	KPA	PSIG	KPA
30RAP	650	4482	500	3447

Clear the alarm using the scrolling marquee display. The unit should restart after the compressor anti-short-cycle delay, built into the unit control module, expires.

PRESSURE TRANSDUCERS

Each refrigerant circuit is equipped with a suction and discharge pressure transducer. These inputs to the MBB are not only used to monitor the status of the unit, but to also maintain operation of the chiller within the compressor manufacturer's specified limits. The input to the MBB from the suction pressure transducer is also used to protect the compressor from operating at low pressure conditions and low superheat conditions. In some cases, the unit may not be able to run at full capacity. The control module will automatically reduce the capacity of a circuit as needed to maintain specified maximum/minimum operating pressures.

COOLER FREEZE-UP PROTECTION

> ⚠ **CAUTION**
>
> On medium temperature brine units, the anti-freeze solution must be properly mixed to prevent freezing at a temperature of at least 15°F (8.3°C) below the leaving-fluid temperature set point. Failure to provide the proper anti-freeze solution mixture may damage the cooler, water piping, and/or hydronic package and is considered abuse and may impair or otherwise negatively impact the Carrier warranty.

The main base board (MBB) monitors leaving fluid temperature at all times. The MBB will rapidly remove stages of capacity as necessary to prevent freezing conditions due to the rapid loss of load or low cooler fluid flow.

When the cooler is exposed to lower ambient temperatures (34°F [1°C] or below), freeze-up protection is required using inhibited ethylene or propylene glycol.

The input from the low pressure transducer provides additional cooler freeze protection. The MBB shuts down the unit when a low pressure condition exists that could cause the cooler to freeze up.

HEATER CABLE

Optional factory-installed cooler and/or hydronic package heaters are cycled based on the input from the outside-air temperature sensor. These heaters, when installed, are designed to protect the cooler and/or hydronic package from freezing down to –20°F (–29°C). Power for these heaters is supplied from the main unit power.

> ⚠ **CAUTION**
>
> Do not disconnect main unit power when servicing compressor(s) if ambient temperature is below 40°F (4.4°C) if the chilled water loop is not protected with an appropriate concentration of an inhibited antifreeze solution. The compressors have a circuit breaker that can be used to shut off power to the compressors. If the chilled water loop is not protected with an appropriate concentration of an inhibited antifreeze solution and power to the unit must be off for a prolonged period, drain the cooler, hydronic package (if installed) and internal piping. Add glycol according to Winter Shutdown Step 2 below. Failure to do so may damage the cooler, water piping, and/or hydronic package.

WINTER SHUTDOWN

Do not shut off power disconnect during off-season shutdown. At end of the cooling season:

1. Drain water from system.
2. Replace drain plug(s) and add sufficient inhibited ethylene glycol (or other suitable inhibited antifreeze) to cooler, pump, and piping to prevent freezing of residual water.
3. At the beginning of the next cooling season, refill the cooler and add the recommended inhibitor.

Thermistors

Electronic control uses up to five 5 kΩ thermistors to sense temperatures used to control operation of the chiller. Thermistors EWT, LWT, RGTA, RGTB, and OAT are identical in their temperature and voltage drop performance. The SPT space temperature thermistor has a 10 kΩ input channel and it has a different set of temperature vs. resistance and voltage drop performance. Resistance at various temperatures are listed in Tables 35-39. For dual chiller operation, a dual chiller sensor is required which is a 5 kΩ thermistor. When a digital compressor is used, a DTT (digital temperature thermistor) is used. The DTT is an 86 kΩ thermistor.

REPLACING THERMISTORS (EWT, LWT, RGT)

Add a small amount of thermal conductive grease to the thermistor well and end of probe. For all probes, tighten the retaining nut $^1/_4$ turn past finger tight. See Fig. 50 and 51. Insulate the thermistor with cork tape or other appropriate insulating material.

THERMISTOR/TEMPERATURE SENSOR CHECK

A high quality digital volt-ohmmeter is required to perform this check.

1. Connect the digital voltmeter across the appropriate thermistor terminals at the J8 terminal strip on the Main Base Board (see Fig. 51).
2. Using the voltage reading obtained, read the sensor temperature from Tables 35-39. Supply voltage to the thermistor should be 4 vdc ± 0.2 v with the thermistor disconnected from the MBB.
3. To check thermistor accuracy, measure temperature at probe location with an accurate thermocouple-type temperature measuring instrument. Insulate thermocouple to avoid ambient temperatures from influencing reading. Temperature measured by thermocouple and temperature determined from thermistor voltage reading should be close, ± 5°F (3°C) if care was taken in applying thermocouple and taking readings.

If a more accurate check is required, unit must be shut down and thermistor removed and checked at a known temperature (freezing point or boiling point of water) using either voltage drop measured across thermistor at the J8 terminal, by determining the resistance with chiller shut down and thermistor disconnected from J8. Compare the values determined with the value read by the control in the Temperatures mode using the scrolling marquee display.

Table 35 — 5K Thermistor Temperatures (°F) vs. Resistance/Voltage Drop
(Voltage Drop for EWT, LWT, DLWT, RGT, and OAT)

TEMP (F)	VOLTAGE DROP (V)	RESISTANCE (OHMS)	TEMP (F)	VOLTAGE DROP (V)	RESISTANCE (OHMS)	TEMP (F)	VOLTAGE DROP (V)	RESISTANCE (OHMS)
−25	3.699	98,010	59	1.982	7,686	143	0.511	1,190
−24	3.689	94,707	60	1.956	7,665	144	0.502	1,165
−23	3.679	91,522	61	1.930	7,468	145	0.494	1,141

70	158	15,070	180	356	830
Fig. 50 — Thermistor Well and Return Gas Thermistor (RGT) Mounting
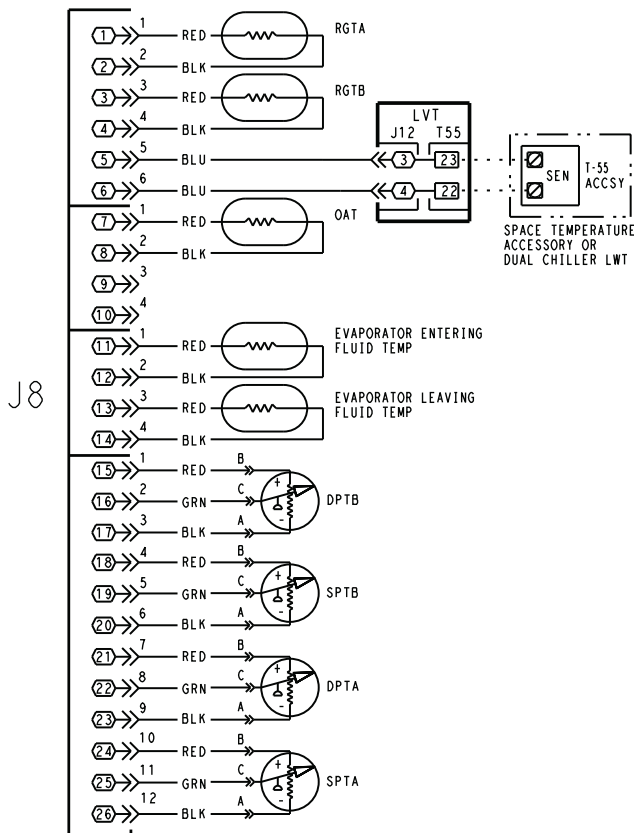

Pressure Transducers

The suction and discharge transducers are different part numbers and can be distinguished by the color of the transducer body, suction (yellow) and discharge (red). No pressure transducer calibration is required. The transducers operate on a 5 vdc supply, which is generated by the main base board (MBB). See Fig. 51 for transducer connections to the J8 connector on the MBB.

TROUBLESHOOTING

If a transducer is suspected of being faulty, first check supply voltage to the transducer. Supply voltage should be 5 vdc ± 0.2 v. If supply voltage is correct, compare the pressure reading displayed on the scrolling marquee display module against pressure shown on a calibrated pressure gauge. Pressure readings should be within ± 15 psig. If the two readings are not reasonably close, replace the pressure transducer.

Chilled Water Flow Switch

A factory-installed flow switch is installed in the leaving fluid piping for all units without the factory-installed hydronic package. See Fig. 52. Units with the optional hydronic package have the flow switch installed in the entering fluid piping. This is a thermal-dispersion flow switch with no field adjustments. The switch is set for approximately 0.5 ft/sec of flow. The sensor tip houses two thermistors and a heater element. One thermistor is located in the sensor tip, closest to the flowing fluid. This thermistor is used to detect changes in the flow velocity of the liquid. The second thermistor is bonded to the cylindrical wall and is affected only by changes in the temperature of the liquid. The thermistors are positioned to be in close contact with the wall of the sensor probe and, at the same time, to be kept separated from each other within the confines of the probe.

LEGEND

LWT — Leaving Water Temperature Sensor
LVT — Low Voltage Terminal
OAT — Outdoor Air Temperature Sensor
RGT — Return Gas Temperature Sensor
SEN — Sensor Terminal Block
SPT — Space Temperature Sensor

Fig. 51 — Thermistor Connections to Main Base Board, J8 Connector

67
Fig. 52 — Chilled Water Flow Switch

In order to sense flow, it is necessary to heat one of the thermistors in the probe. When power is applied, the tip of the probe is heated. As the fluid starts to flow, heat will be carried away from the sensor tip. Cooling of the first thermistor is a function of how fast heat is conducted away by the flowing liquid.

The difference in temperature between the two thermistors provides a measurement of fluid velocity past the sensor probe. When fluid velocity is high, more heat will be carried away from the heated thermistor and the temperature differential will be small. As fluid velocity decreases, less heat will be taken from the heated thermistor and there will be an increase in temperature differential.

When unit flow rate is above the minimum flow rate, then the output is switched on, sending 24 vac to the MBB to prove flow has been established.

For recommended maintenance, check the sensor tip for build-up every 6 months. Clean the tip with a soft cloth. If necessary, build-up (e.g., lime) can be removed with a common vinegar cleansing agent.

The flow sensor cable is provided with 3 LEDs that indicate if 24 vac power is present and also status of the switch contacts. The LEDs are as follows:

- Green LED ON – 24 vac present
- One Yellow LED ON – Flow sensor switch OPEN
- Two Yellow LEDs ON – Flow sensor switch CLOSED

If nuisance trips of the sensor are occurring, follow the steps below to correct the situation:

1. Check to confirm that the factory-installed strainer is clean. Use the blowdown valve provided or remove the screen and clean it. In the case of VFD controlled pumps, ensure that the minimum speed setting has not been changed.

2. Measure the pressure drop across the cooler or cooler/pump system and compare this to the system requirements.

3. Verify that cable connections at the switch and at the terminal block are secure.

4. For factory-installed hydronic systems, verify that:
   a. All air has been purged from the system.
   b. Circuit setter balance valve has been correctly set.

5. Pump impeller has been improperly trimmed and is not providing sufficient flow.

6. Wrong pump motor rotation. Pump must rotate clockwise when viewed from motor end of pump.

Strainer

Periodic factory-installed strainer cleaning is required. Pressure drop across strainer in excess of 3 psi (21 kPa) indicates the need for cleaning. Normal (clean) pressure drop is approximately 1 psi (6.9 kPa). Open the factory-installed blowdown valve to clean the strainer. If required, shut the chiller down and remove the strainer screen to clean. When strainer has been cleaned, enter "YES" for Strainer Maintenance Done (*Run Status→PM→S.T.MN*).

Condenser Fans

Two types of condenser fans are offered in the 30RAP units: metal (value sound) fans, and AeroAcoustic™ (low sound) fans. Each fan is supported by a formed wire mount bolted to a fan deck and covered with a wire guard.

METAL (VALUE SOUND) FANS

The exposed end of fan motor shaft is protected from weather by grease and a rubber boot. If fan motor must be removed for service or replacement, when reinstalling the motor be sure to mount the motor band in the proper location, re-grease fan shaft, and reinstall fan guard. The fan hub must be facing up. For proper performance with the value sound fan option, fan web should be 0.32 in. (8 mm) below top of orifice on the fan deck to top of the fan hub. Tighten set screws to 15 ± 2 ft-lb (20 ± 2.7 N•m). Fig. 53 shows the proper position of mounted fan.

> IMPORTANT: Check for proper fan rotation (clockwise when viewed from above). If necessary, switch any 2 power leads to reverse fan rotation. The anti-rotation tab must be located to the left and adjacent to the motor mounting rod.
Fig. 53 — Metal (Value Sound) Fan Mounted Position

AEROACOUSTIC™ (LOW SOUND) FANS

Two designs have been used for this option and can be distinguished by the mounting bolt color. Two separate processes are used depending on the design revision. A shroud and a wire guard provide protection from the rotating fan.

> IMPORTANT: Check for proper fan rotation (counterclockwise when viewed from above). If necessary, switch any 2 power leads to reverse fan rotation.

Gray Bolt

The fan motor shaft is protected from weather by grease and the fan cover. If fan motor must be removed for service or replacement, when reinstalling the motor be sure to mount the motor band in the proper location. Re-grease fan shaft and reinstall fan cover. The fan motor has a step in the motor shaft. For proper performance, fan should be positioned such that it is securely seated on this step. See Fig. 54. Tighten bolt to 15 ± 2 ft-lb (20 ± 2.7 N•m). Figure 54 shows the proper position of mounted fan.

Black Bolt

To remove the fan, a fan puller will likely be needed. The fan motor shaft is protected from weather by the fan cover. If fan motor must be removed for service or replacement, when reinstalling the motor be sure to mount the motor band in the proper location. Do not use grease on the shaft or key. The fan motor has a step in the motor shaft. For proper performance, fan should be positioned such that it is securely seated on this step. Apply Loctite 680 Retaining Compound to the hub and motor keyway only just prior to installing the key. See Fig. 55 and 56. Tighten bolt to 24 ± 2 ft-lb (32.5 ± 2.7 N•m). Fig. 57 shows the proper position of mounted fan.

Motormaster® V Controller

The Motormaster V (MMV) controller is standard on size 010 and 015 units. For other sizes, the optional or accessory Motormaster V controller uses an input signal from the AUX board. See Fig. 58. The controller is factory configured and requires no field programming. If a situation arises where the drive does not function properly, the information provided below and in Table 40 can be used to troubleshoot the drive.

> ⚠ **WARNING**
>
> Hazard of electrical shock. Wait three minutes after disconnecting incoming power before servicing drive. Capacitors retain charge after power is removed. Drive assembly includes externally mounted current limiting resistors. Use extreme caution when servicing the drive. Failure to comply may result in personal injury.

> ⚠ **WARNING**
>
> When configured as shown in this literature, this equipment is designed to start when it receives line power. Ensure that all personnel are clear of fans and guards are installed before applying power. Failure to comply may result in personal injury.

> ⚠ **WARNING**
>
> The opening of a branch-circuit protective device may be an indication that a fault has been interrupted. To reduce the risk of fire or electric shock, current carrying parts and other components of the controller should be examined and replaced if damaged.

⚠ CAUTION

DO NOT connect incoming AC power to output terminals T1, T2, and T3. Severe damage to the drive will result. Do not continuously cycle input power to the drive more than once every two minutes. Damage to the drive will result.

⚠ CAUTION

If input power has not been applied to the drive for a period of time exceeding three years (due to storage, etc.), the electrolytic DC bus capacitors within the drive can change internally, resulting in excessive leakage current. This can result in premature failure of the capacitors if the drive is operated after such a long period of inactivity or storage. In order to reform the capacitors and prepare the drive for operation after a long period of inactivity, apply input power to the drive for 8 hours prior to actually operating the motor. Before attempting to operate the drive, motor, and driven equipment, be sure all procedures pertaining to installation and wiring have been properly followed. Failure to comply may result in equipment damage.

Table 40 — Fault Codes

FAULT CODE	DESCRIPTION	SOLUTION
AF	High Temperature Fault: Ambient temperature is too high; Cooling fan has failed (if equipped).	Check cooling fan operation
CF	Control Fault: A blank EPM, or an EPM with corrupted data has been installed.	Perform a factory reset using Parameter 48 — PROGRAM SELECTION.
cF	Incompatibility Fault: An EPM with an incompatible parameter version has been installed.	Either remove the EPM or perform a factory reset (Parameter 48) to change the parameter version of the EPM to match the parameter version of the drive.
CL	CURRENT LIMIT: The output current has exceeded the CURRENT LIMIT setting (Parameter 25) and the drive is reducing the output frequency to reduce the output current. If the drive remains in CURRENT LIMIT too long, it can trip into a CURRENT OVERLOAD fault (PF).	Check for loose electrical connections. Check for faulty condenser fan motor. Check Parameter P25 from Table 41 is set correctly.
ER	ERROR: Invalid data has been entered or an invalid command was attempted.	
GF	Data Fault: User data and OEM defaults in the EPM are corrupted.	Restore factory defaults P48, see section above. If that does not work, replace EPM.
HF	High DC Bus Voltage Fault: Line voltage is too high; Deceleration rate is too fast; Overhauling load.	Check line voltage — set P01 appropriately.
JF	Serial Fault: The watchdog timer has timed out, indicating that the serial link has been lost.	Check serial connection (computer). Check settings for P15. Check settings in communication software to match P15.
LC	FAULT LOCKOUT: The drive has failed three restart attempts and requires a manual reset.	
LF	Low DC Bus Voltage Fault: Line voltage is too low.	Check line voltage — set P01 appropriately.
OF	Output Transistor Fault: Phase to phase or phase to ground short circuit on the output; Failed output transistor; Boost settings are too high; Acceleration rate is too fast.	Reduce boost or increase acceleration values. If unsuccessful, replace drive.
PF	Current Overload Fault: VFD is undersized for the application; Mechanical problem with the driven equipment.	Check line voltage — set P01 appropriately. Check for dirty coils. Check for motor bearing failure.
SF	Single-phase Fault: Single-phase input power has been applied to a three-phase drive.	Check input power phasing.
SP	START PENDING: "SP" blinks during the interval between restart attempts.	
F1	EPM Fault: The EPM is missing or damaged.	
F2-F9, Fo	Internal Faults: The control board has sensed a problem.	Consult factory.
Drive display = 60.0 even though it is cold outside and it should be running slower	Feedback signal is above set point.	Check for proper set point. Check liquid line pressure.
Drive display = "---" even though drive should be running	Start jumper is missing.	Replace start jumper. See section above.
Drive display = 8.0 even though fan should be running faster	Feedback signal is below set point and fan is at minimum speed.	Check for proper set point. Check liquid line pressure.
VFD flashes 57 and LCS	Feedback or speed signal lost. Drive will operate at 57 Hz until reset or loss of start command. Resetting requires cycling start command (or power).	In stand alone mode: Check transducer wiring and feedback voltage. Feedback voltage displayed on P-69. Pin 6 should be 5 v output. Pin 5 (feedback) should be somewhere between 0 and 5 v.

VFD — Variable Frequency Drive

GENERAL OPERATION

The speed varies in proportion to a 0 to 10 vdc signal produced by the *Comfort*Link controls. The MMV output speed is displayed in Hz.

The *Comfort*Link controls must be configured for MMV operation in order for it to operate. This is configured under the Configuration menu (*Configuration→MM→MMR.S*) and selecting "1=LOW AMBIENT." This configuration menu also contains the gains and minimum speed for the Motormaster control logic.

CONFIGURATION

The MMV is configured for 1 of 12 operation modes based on the inputs to the control terminal block. The 30RAP units use operating modes 5-8. In these configurations, the MMV follows a 4 to 20 mA speed reference signal present on terminals 25 (+) and 2 (-). The Aux board generates a 2 to 10 vdc signal that is converted to a 4 to 20 mA signal by means of a 240 Ω 1/4 w resistor in series with the positive (+) signal wire. One additional jumper is required to configure the drive for 50/60 Hz operation and input voltage. See Table 41 for proper inputs. Once the drive is powered, it will change to the mode selected according to the inputs. See Fig. 59.

Table 41 — Motormaster® V Program Parameters for Operating Modes

PARAMETERS	DESCRIPTION	MODE 5	MODE 6	MODE 7	MODE 8
P01	Line Voltage: 01 = low line, 02 = high line	01	02	01	02

DRIVE PROGRAMMING

> ⚠️ **CAUTION**
>
> It is strongly recommended that the user NOT change any programming without consulting Carrier service personnel. Unit damage may occur from improper programming.

To change parameter values of the Motormaster V controller:

1. To enter the PROGRAM mode to access the parameters, press the Mode button. This will activate the password prompt (if the password has not been disabled). The display will read "00" and the upper right-hand decimal point will be blinking. See Fig. 59.

2. Use the up and down arrow buttons to scroll to the password value (the factory default password is 111) and press the Mode button to accept the value.

3. Once the correct password value is entered, the display will read P01, which indicates that the PROGRAM mode has been accessed. P01 is the first parameter.

   NOTE: If the display flashes "Er," the password was incorrect and the process to enter the password must be repeated.

4. Use the up and down arrow buttons to scroll to the desired parameter number.

5. Once the desired parameter number is found, press the Mode button to display the present parameter setting. The upper right-hand decimal point will begin blinking, indicating that the present parameter setting is being displayed, and that it can be changed by using the up and down buttons. Use the up and down arrow buttons to change setting. Press Mode to store the new setting and exit the PROGRAM mode.

6. To change another parameter, press the Mode button again to re-enter the PROGRAM mode (the parameter menu will be accessed at the parameter that was last viewed or changed before exiting). If the Mode button is pressed within two minutes of exiting the PROGRAM mode, the password is not required to access the parameters. After two minutes, the password must be entered in order to access the parameters again.

The drive uses an electronic programming module (EPM) chip to store the program parameters. This is an EPROM memory chip and is accessible from the front of the Motormaster V. It should not be removed with power applied to the VFD. See Fig. 59.

Motormaster V Drive Password Configuration

Changing the password is not recommended. Once the password is changed, there is no means to retrieve the new password if it is lost. A new EPM chip must be installed.

To change password, follow the parameter changing instructions in the section Changing Motormaster V Parameters above. Change parameter P44 to the desired password. Setting P44 to 000 disables the password function. Valid range for the password is 000 to 999.

EPM CHIP

The drive uses a electronic programming module (EPM) chip to store the program parameters. This is an EEPROM memory chip and is accessible from the front of the VFD. It should not be removed with power applied to the VFD.

LOSS OF CCN COMMUNICATIONS

Carrier Comfort Network® (CCN) communications with external control systems can be affected by high frequency electrical noise generated by the Motormaster V controller. Ensure unit is well grounded to eliminate ground currents along communication lines.

Fault Codes

The drive is programmed to automatically restart after a fault and will attempt to restart three times after a fault (the drive will not restart after CF, cF, GF, F1, F2-F9, or Fo faults). If all three restart attempts are unsuccessful, the drive will trip into FAULT LOCK-OUT (LC), which requires a manual reset.

Manual Reset

If fault condition has been removed, cycle power to the chiller to reset the VFD.

Troubleshooting

Troubleshooting the Motormaster® V control requires a combination of observing system operation and VFD information. The drive provides 2 kinds of troubleshooting modes: a status matrix using the 3-digit display (P57, P58) and real time monitoring of key inputs and outputs. The collective group is displayed through parameters 50 to 60 and all values are read-only.

- **P50: FAULT HISTORY** — Last 8 faults
- **P51: SOFTWARE version**
- **P52: DC BUS VOLTAGE** — in percent of nominal. Usually rated input voltage x 1.4
- **P53: MOTOR VOLTAGE** — in percent of rated output voltage
- **P54: LOAD** — in percent of drives rated output current rating
- **P55: VDC INPUT** — in percent of maximum input: 100 will indicate full scale which is 5 v
- **P56: 4-20 mA INPUT** — in percent of maximum input. 20% = 4 mA, 100% = 20 mA

Manual Starter Trip

If the VFD manual starter (MS-FC-HS, MS-FC-A1 or MS-FC-B1 depending on model) trips, locate the inrush current protectors (3 round black disks per motor) and verify their resistance. For units operating at 208 v or 230 v, these devices should measure approximately 7 ohms. For all other voltages, they should measure approximately 20 ohms. Check value with mating plug disconnected, power to chiller off and at ambient temperature (not hot immediately after stopping VFD). These are standard resistances at 77°F (25°C). Resistance values decrease at higher temperatures and increase at lower temperatures.

REPLACING DEFECTIVE MODULES

The *Comfort*Link replacement modules are shown in Table 42. If the main base board (MBB) has been replaced, verify that all configuration data is correct. Follow the **Configuration** mode table and verify that all items under sub-modes **UNIT**, **OPT1** and **OPT2** are correct. Any additional field-installed accessories or options (**RSET**, **SLCT** sub-modes) should also be verified as well as any specific time and maintenance schedules.

Refer to the Start-Up Checklist for 30RAP Liquid Chiller (completed at time of original start-up) found in the job folder. This information is needed later in this procedure. If the checklist does not exist, fill out the current information in the Configuration mode on a new checklist. Tailor the various options and configurations as needed for this particular installation.

> **⚠ WARNING**
>
> Electrical shock can cause personal injury and death. Shut off all power to this equipment during installation. There may be more than one disconnect switch. Tag all disconnect locations to alert others not to restore power until work is completed.

---

1. Check that all power to unit is off. Carefully disconnect all wires from the defective module by unplugging its connectors.

applicable pump curve. See base unit installation instructions.

2. Remove the defective module by removing its mounting screws with a Phillips screwdriver, and removing the module from the control box. Save the screws for later use.

3. Verify that the instance jumper (MBB) or address switches (all other modules) exactly match the settings of the defective module.

   NOTE: Handle boards by mounting standoffs only to avoid electrostatic discharge.

4. Package the defective module in the carton of the new module for return to Carrier.

5. Mount the new module in the unit's control box using a Phillips screwdriver and the screws saved in Step 2. See Table 42 for replacement module part numbers.

6. Reinstall all module connectors. For accessory Navigator™ display replacement, make sure the plug is installed at TB3 in the LEN connector.

7. Carefully check all wiring connections before restoring power.

8. Verify the Enable/Off/Remote Control switch is in the OFF position.

9. Restore control power. Verify that all module red LEDs blink in unison. Verify that all green LEDs are blinking and that the scrolling marquee or Navigator display is communicating correctly.

10. Verify all configuration information, settings, set points, and schedules. Return the Enable/Off/Remote Control switch to its previous position.

Table 42 — Replacement Modules

MODULE	REPLACEMENT PART NO. (WITH SOFTWARE)	REPLACEMENT PART NO. (WITHOUT SOFTWARE)

AUX	32GB500442E	N/A
CXB	30GT515219	HK50AA027

Hydronic Package

If the unit is equipped with a factory-installed hydronic package, consult the information below for proper maintenance and service. In addition to this information, each factory-installed hydronic package is supplied with a packet of information supplied by the manufacturer, Bell & Gossett. Carrier strongly recommends that this information be thoroughly reviewed prior to operation of the chiller.

PUMP PERFORMANCE CHECK

The factory-installed pumps in the 30RAP units are shipped with a single impeller size available for that pump. The pump was selected based on the flow and head requirements as provided to Carrier. It is not uncommon for actual pump duty to be different than what was anticipated at time of selection. In many cases, it may be desirable to make some field modifications to obtain optimum pump performance.

Before any pump modifications are made, it is recommended that actual pump performance be verified and compared to the

This can be done in a variety of ways:

1. If pump impeller diameter is known:
   a. Connect a differential pressure gage across the pump at the ports provided on the pump volutes.
   b. Read GPM from applicable impeller curve.
2. If pump impeller diameter is not known:

   If pump impeller diameter has been trimmed and the size is not known, it is necessary to determine which impeller curve to read.

   The easiest way to confirm pump performance is to "dead-head" the pump and read the differential pressure across the pressure ports on the pump. "Dead-heading" can be done by shutting the circuit setter valve on the discharge side of the pump.

   NOTE: Although not all pumps can be safely "dead-headed," centrifugal pumps (such as on the 30RAP units) can be "dead-headed" for short amounts of time. It is recommended to keep the time short due to excessive heat build-up in the pump.

   Since the "dead-head" condition is a no-flow condition, the head will correspond to the intersection of an impeller curve with the vertical axis of the pump chart. The correct impeller diameter is that which corresponds to the measured head.
3. Once the impeller diameter is known, proceed as in Step 1.
4. Water flow rate can be determined by using a differential pressure gage with the Bell & Gossett circuit setter balance valve calculator or Armstrong Circuit Balancing Valve Slide Rule. (This information is also provided in the installation instructions.) This method will not directly measure pressure differential seen by the pump, but can be used to "double-check" the pump measurement.
5. Verify that cable connections at the switch and at the terminal block are secure.
6. For factory-installed hydronic system, verify that:
   a. All air has been purged from the system.
   b. Circuit setter balance valve has been correctly set.
7. Pump impeller has been improperly trimmed and is not providing sufficient flow.
8. Wrong pump motor rotation. Pump must rotate clockwise when viewed from motor end of pump.

PUMP MODIFICATIONS AND IMPELLER TRIMMING

See applicable section in the Installation instructions.

RESET OF CHILLER WATER FLOW

See applicable section in the Installation instructions.

CHANGING OF PUMP SEALS

See service instruction manual provided with the hydronic package.

VFD OPERATION

For units with factory-installed VFD (variable frequency drive) option, see service instruction manual provided with the hydronic package. Default password is 00002323.

MAINTENANCE

Recommended Maintenance Schedule

The following are only recommended guidelines. Jobsite conditions may dictate that maintenance schedule is performed more often than recommended.

ROUTINE:
- Periodic clean water rinse, especially in coastal and industrial applications.
- Check condenser coils for debris, clean as necessary.

EVERY MONTH:
- Check moisture indicating sight glass for possible refrigerant loss and presence of moisture.

EVERY 3 MONTHS (FOR ALL MACHINES):
- Check refrigerant charge.
- Check all refrigerant joints and valves for refrigerant leaks, repair as necessary.
- Check chilled water flow switch operation.
- Check all condenser fans for proper operation.
- Check compressor oil level.
- Check crankcase heater operation if equipped.

EVERY 6 MONTHS:
- Check chilled water flow switch sensor tip for buildup. Clean if necessary. See page page 67.

EVERY 12 MONTHS (FOR ALL MACHINES):
- Check all electrical connections, tighten as necessary.
- Inspect all contactors and relays, replace as necessary.
- Check accuracy of thermistors, replace if greater than ± 2°F (1.2°C) variance from calibrated thermometer.
- Check to be sure that the proper concentration of antifreeze is present in the chilled water loop, if applicable.
- Verify that the chilled water loop is properly treated.
- Check refrigerant filter driers for excessive pressure drop, replace as necessary.
- Check chilled water strainers, clean as necessary.
- Check cooler heater operation, if equipped.
- Check condition of condenser fan blades and that they are securely fastened to the motor shaft.
- Perform Service Test to confirm operation of all components.
- Check for excessive cooler approach (Leaving Chilled Water Temperature — Saturated Suction Temperature) which may indicate fouling. Clean cooler vessel if necessary.

Condenser Coil Maintenance and Cleaning Recommendations

Routine cleaning of coil surfaces is essential to maintain proper operation of the unit. See the following sections:
- MCHX condenser coils — See page 61.
- RTPF condenser coils — See page 61.

Control Box Maintenance

The control panel for 30RAP100-150 208/230 v and 380 v units has two 24-v fans installed at the right side of the panel to modulate the inside temperature of the control box. These two fans are controlled by a temperature switch. The temperature switch closes at 120°F and opens at 105°F. The inlet filter is located at the left side of the control box. Inspect the inlet filter and fan outlet screen every three months, clean as needed.

TROUBLESHOOTING

Complete Unit Stoppage and Restart

Possible causes for unit stoppage and reset methods are shown below and in Table 43. Refer to Fig. 3-19 for component arrangement and control wiring diagrams.

GENERAL POWER FAILURE

After power is restored, restart is automatic through normal MBB start-up.

UNIT ENABLE-OFF-REMOTE CONTROL SWITCH IS OFF

When the switch is OFF, the unit will stop immediately. Place the switch in the ENABLE position for local switch control or in the Remote Control position for control through Remote Control closure.

CHILLED FLUID PROOF-OF-FLOW SWITCH OPEN

After the problem causing the loss of flow has been corrected, reset is manual by resetting the alarm with the scrolling marquee as shown in Table 44.

OPEN 24-V CONTROL CIRCUIT BREAKER(S)

Determine the cause of the failure and correct. Reset circuit breaker(s). Restart is automatic after MBB start-up cycle is complete.

COOLING LOAD SATISFIED

Unit shuts down when cooling load has been satisfied. Unit restarts when required to satisfy leaving fluid temperature set point.

THERMISTOR FAILURE

If a thermistor fails in either an open or shorted condition, the unit will be shut down. Replace EWT, LWT, or OAT as required. Unit restarts automatically, but must be reset manually by resetting the alarm with the scrolling marquee as shown in Table 44.

> ⚠ **CAUTION**
>
> If unit stoppage occurs more than once as a result of any of the safety devices listed, determine and correct cause before attempting another restart.

Table 43 — Troubleshooting

SYMPTOMS	CAUSE	REMEDY
Cooler Circulating Pump Does Not Run	Power line open	Reset circuit breaker.
	Control fuse or circuit breaker open	Check control circuit for ground or short. Reset breaker and replace fuse.
	Tripped power breaker	Check the controls. Find the cause of trip and reset breaker.
	Loose terminal connection	Check connections.
	Improperly wired controls	Check wiring and rewire if necessary.
	Low line voltage	Check line voltage — determine location of voltage drop and remedy deficiency.
	Pump motor defective	Check motor winding for open or short. Replace compressor if necessary.
	Pump seized	Replace pump.
Compressor Cycles Off on Loss of Charge	Low refrigerant charge	Repair leak and recharge.
Compressor Cycles Off on Cooler Freeze Protection	Thermistor failure	Replace thermistor.
	System load was reduced faster than controller could remove stages	Unit will restart after fluid temperature rises back into the control band. Avoid rapidly removing system load.
Compressor Shuts Down on High-Pressure Control	High-pressure control acting erratically	Replace control.
	Noncondensables in system	Evacuate and recharge.
	Condenser dirty	Clean condenser.
	Fans not operating	Repair or replace if defective.
	System overcharged with refrigerant	Reduce charge.
Unit Operates Too Long or Continuously	Low refrigerant charge	Add refrigerant.
	Control contacts fused	Replace control.
	Partially plugged or plugged expansion valve or filter drier	Clean or replace as needed.
	Defective insulation	Replace or repair as needed.
	Damaged compressor	Check compressor and replace if necessary.
Unusual or Loud System Noises	Piping vibration	Support piping as required.
		Check for loose pipe connections or damaged compressor.
	Compressor noisy	Replace compressor (worn bearings).
		Check for loose compressor holddown bolts.
Compressor Loses Oil	Leak in system	Repair leak.
	Mechanical damage (Failed seals or broken scrolls)	Replace compressor.
	Oil trapped in line	Check piping for oil traps.
Hot Liquid Line	Shortage of refrigerant due to leak	Repair leak and recharge.
Frosted Liquid Line	Restricted filter drier	Replace filter drier.
Frosted Suction Line	Expansion valve admitting excess refrigerant (note: this is a normal condition for brine applications)	Replace valve if defective.
	Stuck EXV (electronic expansion valve)	Replace valve if defective.
Freeze-Up	Improper charging	Make sure a full quantity of fluid is flowing through the cooler while charging, and suction pressure in cooler is equal to or greater than pressure corresponding to 32°F (0°C).
	System not drained for winter shutdown	Recommended that system be filled with an appropriate glycol mixture to prevent freezing of pumps and fluid tubing.
	Loose thermistor	Verify thermistors are fully inserted in wells.

Table 44 — Alarm and Alert Codes

ALARM/ ALERT CODE	ALARM OR ALERT	DESCRIPTION	WHY WAS THIS ALARM GENERATED?	ACTION TAKEN BY CONTROL	RESET METHOD	PROBABLE CAUSE
P051	Pre-Alert	Circuit A, Compressor 1 Failure	Compressor feedback signal does not match relay state	Compressor A1 Shut down for 5 minutes	Automatic	High-pressure switch open, solid-state motor protection module, internal overload open, faulty CSB, loss of condenser air, filter drier plugged, non-condensables, operation beyond capability.
P052	Pre-Alert	Circuit A, Compressor 2 Failure	Compressor feedback signal does not match relay state	Compressor A2 Shut down for 5 minutes	Automatic	High-pressure switch open, solid-state motor protection module, internal overload open, faulty CSB, loss of condenser air, filter drier plugged, non-condensables, operation beyond capability.
P053	Pre-Alert	Circuit A, Compressor 3 Failure	Compressor feedback signal does not match relay state	Compressor A3 Shut down for 5 minutes	Automatic	High-pressure switch open, solid-state motor protection module, internal overload open, faulty CSB, loss of condenser air, filter drier plugged, non-condensables, operation beyond capability.
P055	Pre-Alert	Circuit B, Compressor 1 Failure	Compressor feedback signal does not match relay state	Compressor B1 Shut down for 5 minutes	Automatic	High-pressure switch open, solid-state motor protection module, internal overload open, faulty CSB, loss of condenser air, filter drier plugged, non-condensables, operation beyond capability.
P056	Pre-Alert	Circuit B, Compressor 2 Failure	Compressor feedback signal does not match relay state	Compressor B2 Shut down for 5 minutes	Automatic	High-pressure switch open, solid-state motor protection module, internal overload open, faulty CSB, loss of condenser air, filter drier plugged, non-condensables, operation beyond capability.
P057	Pre-Alert	Circuit B, Compressor 3 Failure	Compressor feedback signal does not match relay state	Compressor B3 Shut down for 5 minutes	Automatic	High-pressure switch open, solid-state motor protection module, internal overload open, faulty CSB, loss of condenser air, filter drier plugged, non-condensables, operation beyond capability.
T051	Alert	Circuit A, Compressor 1 Failure	3 consecutive P051 Pre-Alerts without compressor feedback signal matching relay state.	Compressor A1 shut down.	Manual	High-pressure switch open, solid-state motor protection module, internal overload open, faulty CSB, loss of condenser air, filter drier plugged, non-condensables, operation beyond capability.
A051	Alarm	Circuit A, Compressor 1 Stuck On Failure	CSB reads ON while the compressor relay has been commanded OFF	Compressor A1 shut down	Manual	Welded compressor contactor, welded relay output on MBB or CXB, failed CSB or wiring error.
A051	Alarm	Circuit A, Compressor 1 Chattering Contactor	CSB reads current/no current/current/no current cycling in any 16 second window.	Compressor A1 shut down	Manual	Refrigerant charge, wiring error, plugged condenser coil, condenser fan motor failure.
T052	Alert	Circuit A, Compressor 2 Failure	3 consecutive P052 Pre-Alerts without compressor feedback signal matching relay state.	Compressor A2 shut down.	Manual	High-pressure switch open, solid-state motor protection module, internal overload open, faulty CSB, loss of condenser air, filter drier plugged, non-condensables, operation beyond capability.
A052	Alarm	Circuit A, Compressor 2 Stuck On Failure	CSB reads ON while the compressor relay has been commanded OFF	Compressor A2 shut down	Manual	Welded compressor contactor, welded relay output on MBB or CXB, failed CSB or wiring error.
A052	Alarm	Circuit A, Compressor 2 Chattering Contactor	CSB reads current/no current/current/no current cycling in any 16 second window.	Compressor A2 shut down	Manual	Refrigerant charge, wiring error, plugged condenser coil, condenser fan motor failure.
T053	Alert	Circuit A, Compressor 3 Failure	3 consecutive P053 Pre-Alerts without compressor feedback signal matching relay state.	Compressor A3 shut down.	Manual	High-pressure switch open, solid-state motor protection module, internal overload open, faulty CSB, loss of condenser air, filter drier plugged, non-condensables, operation beyond capability.
A053	Alarm	Circuit A, Compressor 3 Stuck On Failure	CSB reads ON while the compressor relay has been commanded OFF	Compressor A3 shut down	Manual	Welded compressor contactor, welded relay output on MBB or CXB, failed CSB or wiring error.
A053	Alarm	Circuit A, Compressor 3 Chattering Contactor	CSB reads current/no current/current/no current cycling in any 16 second window.	Compressor A3 shut down	Manual	Refrigerant charge, wiring error, plugged condenser coil, condenser fan motor failure.

See Legend on page 82.

Table 44 — Alarm and Alert Codes (cont)

ALARM/ ALERT CODE	ALARM OR ALERT	DESCRIPTION	WHY WAS THIS ALARM GENERATED?	ACTION TAKEN BY CONTROL	RESET METHOD	PROBABLE CAUSE
T055	Alert	Circuit B, Compressor 1 Failure	3 consecutive P055 Pre-Alerts without compressor feedback signal matching relay state.	Compressor B1 shut down.	Manual	High-pressure switch open, solid-state motor protection module, internal overload open, faulty CSB, loss of condenser air, filter drier plugged, non-condensables, operation beyond capability.
A055	Alarm	Circuit B, Compressor 1 Stuck On Failure	CSB reads ON while the compressor relay has been commanded OFF	Compressor B1 shut down	Manual	Welded compressor contactor, welded relay output on MBB or CXB, failed CSB or wiring error.
	Alarm	Circuit B, Compressor 1 Chattering Contactor	CSB reads current/no current/ current/no current cycling in any 16 second window.	Compressor B1 shut down	Manual	Refrigerant charge, wiring error, plugged condenser coil, condenser fan motor failure.
T056	Alert	Circuit B, Compressor 2 Failure	3 consecutive P056 Pre-Alerts without compressor feedback signal matching relay state.	Compressor B2 shut down.	Manual	High-pressure switch open, solid-state motor protection module, internal overload open, faulty CSB, loss of condenser air, filter drier plugged, non-condensables, operation beyond capability.
A056	Alarm	Circuit B, Compressor 2 Stuck On Failure	CSB reads ON while the compressor relay has been commanded OFF	Compressor B2 shut down	Manual	Welded compressor contactor, welded relay output on MBB or CXB, failed CSB or wiring error.
	Alarm	Circuit B, Compressor 2 Chattering Contactor	CSB reads current/no current/ current/no current cycling in any 16 second window.	Compressor B2 shut down	Manual	Refrigerant charge, wiring error, plugged condenser coil, condenser fan motor failure.
T057	Alert	Circuit B, Compressor 3 Failure	3 consecutive P057 Pre-Alerts without compressor feedback signal matching relay state.	Compressor B3 shut down.	Manual	High-pressure switch open, solid-state motor protection module, internal overload open, faulty CSB, loss of condenser air, filter drier plugged, non-condensables, operation beyond capability.
A057	Alarm	Circuit B, Compressor 3 Stuck On Failure	CSB reads ON while the compressor relay has been commanded OFF	Compressor B3 shut down	Manual	Welded compressor contactor, welded relay output on MBB or CXB, failed CSB or wiring error.
	Alarm	Circuit B, Compressor 3 Chattering Contactor	CSB reads current/no current/ current/no current cycling in any 16 second window.	Compressor B3 shut down	Manual	Refrigerant charge, wiring error, plugged condenser coil, condenser fan motor failure.
A060	Alarm	Cooler Leaving Fluid Thermistor Failure	Thermistor outside range of –40 to 245°F (–40 to 118°C)	Chiller shut down immediately	Automatic	Thermistor failure, damaged cable/wire or wiring error.
A061	Alarm	Cooler Entering Fluid Thermistor Failure	Thermistor outside range of –40 to 245°F (–40 to 118°C)	Chiller shut down immediately	Automatic	Thermistor failure, damaged cable/wire or wiring error.
T068	Alert	Circuit A Return Gas Thermistor Failure	Return gas thermistor is outside range of –40 to 245°F (–40 to 118°C)	Circuit A shut down	Automatic	Thermistor failure, damaged cable/wire or wiring error.
T069	Alert	Circuit B Return Gas Thermistor Failure	Return gas thermistor is outside range of –40 to 245°F (–40 to 118°C)	Circuit B shut down	Automatic	Thermistor failure, damaged cable/wire or wiring error.
T073	Alert	Outside Air Thermistor Failure	Thermistor outside range of –40 to 245°F (–40 to 118°C)	Temperature reset disabled. Chiller runs under normal control/set points. When capacity reaches 0, cooler/pump heaters are energized.	Automatic	Thermistor failure, damaged cable/wire or wiring error.
T074	Alert	Space Temperature/ Dual Chiller Thermistor Failure	Thermistor outside range of –40 to 245°F (–40 to 118°C)	Temperature reset disabled. Chiller runs under normal control/set points.	Automatic	Thermistor failure, damaged cable/wire or wiring error.
T077	Alert	Circuit A Saturated Suction Temperature exceeds Cooler Leaving Fluid Temperature	Saturated suction temperature is greater than leaving fluid temperature for 5 minutes.	Circuit A shutdown	Manual	Faulty expansion valve or suction pressure transducer or leaving fluid thermistor.
T078	Alert	Circuit B Saturated Suction Temperature exceeds Cooler Leaving Fluid Temperature	Saturated suction temperature is greater than leaving fluid temperature for 5 minutes.	Circuit B shutdown	Manual	Faulty expansion valve or suction pressure transducer or leaving fluid thermistor.
T079	Alert	Lead/Lag LWT Thermistor Failure	Thermistor outside range of –40 to 245°F (–40 to 118°C)	Chiller runs as a stand alone machine	Automatic	Dual LWT thermistor failure, damaged cable/wire or wiring error.
T090	Alert	Circuit A Discharge Pressure Transducer Failure	Outside of range (0 to 667 psig)	Circuit A shut down	Automatic	Transducer failure, poor connection to MBB, or wiring damage/error.
T091	Alert	Circuit B Discharge Pressure Transducer Failure	Outside of range (0 to 667 psig)	Circuit B shut down	Automatic	Transducer failure, poor connection to MBB, or wiring damage/error.
T092	Alert	Circuit A Suction Pressure Transducer Failure	Outside of range (0 to 420 psig)	Circuit A shut down	Automatic	Transducer failure, poor connection to MBB, or wiring damage/error.

See Legend on page 82.

Table 44 — Alarm and Alert Codes (cont)

ALARM/ ALERT CODE	ALARM OR ALERT	DESCRIPTION	WHY WAS THIS ALARM GENERATED?	ACTION TAKEN BY CONTROL	RESET METHOD	PROBABLE CAUSE
T093	Alert	Circuit B Suction Pressure Transducer Failure	Outside of range (0 to 420 psig)	Circuit B shut down	Automatic	Transducer failure, poor connection to MBB, or wiring damage/error.
T094	Alert	Discharge Gas Thermistor Failure	Discharge thermistor (DTT) is either open or shorted	Size 010,015 chiller shut down. Digital compressor shut down.	Automatic	Thermistor failure, damaged cable/wire or wiring error.
T110	Alert	Circuit A Loss of Charge	If the compressors are off and discharge pressure reading is < 26 psig for 30 sec.	Circuit not allowed to start.	Manual	Refrigerant leak or transducer failure
T111	Alert	Circuit B Loss of Charge	If the compressors are off and discharge pressure reading is < 26 psig for 30 sec.	Circuit not allowed to start.	Manual	Refrigerant leak or transducer failure
T112	Alert	Circuit A High Saturated Suction Temperature	Circuit saturated suction temperature pressure transducer > 70°F (21.1°C) for 5 minutes	Circuit shut down	Manual	Faulty Expansion valve, faulty suction pressure transducer or high entering fluid temperature.
T113	Alert	Circuit B High Saturated Suction Temperature	Circuit saturated suction temperature pressure transducer > 70°F (21.1°C) for 5 minutes	Circuit shut down	Manual	Faulty Expansion valve, faulty suction pressure transducer or high entering fluid temperature.
T114	Alert	Circuit A Low Suction Superheat	Suction superheat is less than 3°F (1.7°C) for 5 minutes.	Circuit A shut down.	Automatic restart after first daily occurrence. Manual restart thereafter.	Faulty expansion valve, faulty suction pressure transducer, faulty suction gas thermistor, circuit overcharged
T115	Alert	Circuit B Low Suction Superheat	Suction superheat is less than 3°F (1.7°C) for 5 minutes.	Circuit B shut down.	Automatic restart after first daily occurrence. Manual restart thereafter.	Faulty expansion valve, faulty suction pressure transducer, faulty suction gas thermistor, circuit overcharged
T116	Alert	Circuit A Low Cooler Suction Temperature	Mode 7 caused the compressor to unload 3 consecutive times with less than a 30-minute interval between each circuit shutdown.	Circuit shut down	Manual	Faulty expansion valve, low refrigerant charge, plugged filter drier, faulty suction pressure transducer, low cooler fluid flow, improper brine freeze set point
T117	Alert	Circuit B Low Cooler Suction Temperature	Mode 8 caused the compressor to unload 3 consecutive times with less than a 30-minute interval between each circuit shutdown.	Circuit shut down	Manual	Faulty expansion valve, low refrigerant charge, plugged filter drier, faulty suction pressure transducer, low cooler fluid flow, improper brine freeze set point
P118	Pre-Alert	High Discharge Gas Temperature	Discharge Thermistor (DTT) reading is greater than 250°F	Compressor A1 shut down	Automatic	Refrigerant charge, plugged filter drier, head pressure control.
T118/ A118	Alert	High Discharge Gas Temperature	3 Discharge Gas Temperature alerts occur within a day	Compressor A1 shut down	Manual	Refrigerant charge, plugged filter drier, head pressure control.
T126	Alert	Circuit A High Head Pressure	Compressor operation outside of operating envelope.	Circuit shut down	Automatic, only after first 3 daily occurrences. Manual reset thereafter. Reading from OAT sensor must drop 5°F (2.8°C) before restart	Faulty transducer, low/restricted condenser airflow, incorrect refrigerant charge, non-condensables, faulty condenser fan motor, faulty EXV.
T127	Alert	Circuit B High Head Pressure	Compressor operation outside of operating envelope.	Circuit shut down	Automatic, only after first 3 daily occurrences. Manual reset thereafter. Reading from OAT sensor must drop 5°F (2.8°C) before restart	Faulty transducer/ restricted condenser airflow, incorrect refrigerant charge, non-condensables, faulty condenser fan motor, faulty EXV.
T133	Alert	Circuit A Low Suction Pressure	Suction pressure below 34 psig for 8 seconds or below 23 psig	Circuit shut down	Automatic restart after first daily occurrence. Manual restart thereafter.	Faulty or sticking EXV, low refrigerant charge, plugged filter drier.

See Legend on page 82.

Table 44 — Alarm and Alert Codes (cont)

ALARM/ ALERT CODE	ALARM OR ALERT	DESCRIPTION	WHY WAS THIS ALARM GENERATED?	ACTION TAKEN BY CONTROL	RESET METHOD	PROBABLE CAUSE
T134	Alert	Circuit B Low Suction Pressure	Suction pressure below 34 psig for 8 seconds or below 23 psig	Circuit shut down	Automatic restart after first daily occurrence. Manual restart thereafter.	Faulty or sticking EXV, low refrigerant charge, plugged filter drier.
A140	Alarm	Reverse Rotation Detected	Suction pressure failed to drop when compressor is energized	Chiller not allowed to start.	Manual	Verify correct compressor rotation. Check for correct fan rotation first.
A150	Alarm	Unit is in Emergency Stop	CCN emergency stop command received	Chiller shutdown	Automatic once CCN command for EMSTOP returns to normal	CCN Network command.
A151	Alarm	Illegal Configuration	One or more illegal configurations exists.	Chiller is not allowed to start.	Manual once configuration errors are corrected	Configuration error. Check unit settings.
A152	Alarm	Unit Down Due to Failure	Both circuits are down due to alarms/alerts.	Chiller is unable to run.	Automatic once alarms/alerts are cleared that prevent the chiller from starting.	Alarm notifies user that chiller is 100% down.
T153	Alert	Real Time Clock Hardware Failure	Internal clock on MBB fails	Occupancy schedule will not be used. Chiller defaults to Local On mode.	Automatic when correct clock control restarts.	Time/Date/Month/Day/Year not properly set.
A154	Alarm	Serial EEPROM Hardware Failure	Hardware failure with MBB	Chiller is unable to run.	Manual	Main Base Board failure.
T155	Alert	Serial EEPROM Storage Failure	Configuration/storage failure with MBB	No Action	Manual	Potential failure of MBB. Download current operating software. Replace MBB if error occurs again.
A156	Alarm	Critical Serial EEPROM Storage Failure	Configuration/storage failure with MBB	Chiller is not allowed to run.	Manual	Main Base Board failure.
A157	Alarm	A/D Hardware Failure	Hardware failure with peripheral device	Chiller is not allowed to run.	Manual	Main Base Board failure.
T170	Alert	Loss of communication with the Compressor Expansion Module	MBB cannot communicate with CXB	Compressor A1 shut down	Automatic	Wiring error, faulty wiring or failed CXB. Incorrect configuration.
A172	Alarm	Loss of Communication with EXV board	MBB loses communication with EXV board	Chiller is not allowed to run.	Automatic	Wiring error, faulty wiring or failed EXV board.
T173	Alert	Loss of Communication with EMM	MBB loses communication with EMM	4 to 20 mA temperature reset disabled. Demand Limit set to 100%. 4 to 20 mA set point disabled.	Automatic	Wiring error, faulty wiring or failed Energy Management Module (EMM).
T174	Alert	4 to 20 mA Cooling Set Point Input Failure	If configured with EMM and input less than 2 mA or greater than 22 mA	Set point function disabled. Chiller controls to CSP1.	Automatic	Faulty signal generator, wiring error, or faulty EMM.
T175	Alert	Loss of Communication with the AUX Board	MBB loses communication with AUX Board.	Chiller is not allowed to run.	Automatic	Wiring error, faulty wiring or failed AUX board, incorrect configuration.
T176	Alert	4 to 20 mA Temperature Reset Input Failure	If configured with EMM and input less than 2 mA or greater than 22 mA	Reset function disabled. Chiller returns to normal set point control.	Automatic	Faulty signal generator, wiring error, or faulty EMM.
T177	Alert	4 to 20 mA Demand Limit Input Failure	If configured with EMM and input less than 2 mA or greater than 22 mA	Demand limit function disabled. Chiller returns to 100% demand limit control.	Automatic	Faulty signal generator, wiring error, or faulty EMM.
A179	Alarm	Fan VFD Communication Failure	The MBB lost communication with the Danfoss VFD1 module.	Chiller shut down.	Automatic	Wrong VFD address, damaged communication cable, wiring error, no power to VFD, unresponsive VFD.
A189	Alarm	Cooler Pump Auxiliary Contact Inputs Miswired	Pump 1 Auxiliary Contacts are closed when Pump 2 output is energized or if Pump 2 Auxiliary Contacts are closed when Pump 1 output is energized.	Both pump outputs are turned off.	Automatic	Wiring error, faulty pump contactor auxiliary contacts.
T190	ALERT	Cooler Pump 1 Aux Contacts Failed to Close at Start-Up	Pump 1 Auxiliary Contacts did not close within 26 seconds after pump was started	Pump 1 turned off. Pump 2 will be started if available.	Manual	Wiring error, faulty contacts on pump contactor

See Legend on page 82.

80

Table 44 — Alarm and Alert Codes (cont)

ALARM/ ALERT CODE	ALARM OR ALERT	DESCRIPTION	WHY WAS THIS ALARM GENERATED?	ACTION TAKEN BY CONTROL	RESET METHOD	PROBABLE CAUSE
T191	ALERT	Cooler Pump 2 Aux Contacts Failed to Close at Start-Up	Pump 2 Auxiliary Contacts did not close within 26 seconds after pump was started	Pump 2 turned off. Pump 1 will be started if available.	Manual	Wiring error, faulty contacts on pump contactor
T192	Alert	Cooler Pump 1 Failed to Provide Flow at Start-Up	Pump 1 did not provide flow to close flow switch within 60 seconds	Pump 1 turned off. Pump 2 will be started if available.	Manual	Wiring error, pump circuit breaker tripped, contactor failure
T193	Alert	Cooler Pump 2 Failed to Provide Flow at Start-Up	Pump 2 did not provide flow to close flow switch within 60 seconds	Pump 1 turned off. Pump 2 will be started if available.	Manual	Wiring error, pump circuit breaker tripped, contactor failure
T194	Alert	Cooler Pump 1 Aux Contacts Opened During Normal Operation	Pump 1 Auxiliary Contacts open for 26 seconds after initially made. All compressors shut down. Pump 1 turned off.	Pump 2 will be started if available. Chiller allowed to run if Pump 2 successfully starts	Manual	Wiring error, faulty contacts on pump contactor
T195	Alert	Cooler Pump 2 Aux Contacts Opened During Normal Operation	Pump 2 Auxiliary Contacts open for 26 seconds after initially made. All compressors shut down. Pump 2 turned off.	Pump 1 will be started if available. Chiller allowed to run if Pump 1 successfully starts.	Manual	Wiring error, faulty contacts on pump contactor
T196	Alert	Flow Lost While Pump 1 Running	Cooler flow switch contacts open for 3 seconds after initially made	All compressors shut down. Pump 1 turned off. Pump 2 will be started if available. Chiller allowed to run if Pump 2 successfully starts and flow switch is closed.	Manual	Wiring error, pump circuit breaker tripped, contactor failure
T197	Alert	Flow Lost While Pump 2 Running	Cooler flow switch contacts open for 3 seconds after initially made	All compressors shut down. Pump 2 turned off. Pump 1 will be started if available. Chiller allowed to run if Pump 1 successfully starts and flow switch is closed.	Manual	Wiring error, pump circuit breaker tripped, contactor failure
A198	Alarm	Cooler Pump 1 Aux Contacts Closed While Pump Off	Pump 1 Auxiliary Contacts closed for 2 minutes when pump state is off	Chiller not allowed to start	Manual when aux contacts open	Wiring error, faulty pump contactor (welded contacts), pump in hand position
A199	Alert	Cooler Pump 2 Aux Contacts Closed While Pump Off	Pump 2 Auxiliary Contacts closed for 2 minutes when pump state is off	Chiller not allowed to start	Manual when aux contacts open	Wiring error, faulty pump contactor (welded contacts), pump in hand position
P200 /A200	Pre-Alert/ Alarm	Cooler Flow/Interlock Contacts Failed to Close at Start-Up	Cooler flow switch contacts failed to close within 1 minute (if cooler pump control is enabled) or within 5 minutes (if cooler pump control is not enabled) after start-up	Chiller not allowed to start. For models with dual pumps, the second pump will be started if available	Manual	Wiring error, pump circuit breaker tripped, contactor failure, faulty flow switch or interlock
P201 /A201	Pre-Alert/ Alarm	Cooler Flow/Interlock Contacts Opened During Normal Operation	Flow switch opens for at least 3 seconds after being initially closed	All compressors shut down. For models with dual pumps, the second pump will be started if available	Automatic (P201) or Manual (A201)	Cooler pump failure, faulty flow switch or interlock, pump circuit breaker tripped
A202	Alarm	Cooler Pump Interlock Closed When Pump is Off	If configured for cooler pump control and flow switch input is closed for 5 minutes while pump output(s) are off	Chiller not allowed to start	Automatic when aux contacts open	Wiring error, faulty pump contactor (welded contacts)
T203	Alert	Loss of Communication with Slave Chiller	Master chiller MBB loses communication with slave chiller MBB	Dual chiller control disabled. Chiller runs as a stand-alone machine.	Automatic	Wiring error, faulty wiring, failed Slave chiller MBB module, power loss at slave chiller, wrong slave address.
T204	Alert	Loss of Communication with Master Chiller	Slave chiller MBB loses communication with master chiller MBB	Dual chiller control disabled. Chiller runs as a stand-alone machine	Automatic	Wiring error, faulty wiring, failed master chiller MBB module, power loss at Master chiller.
T205	Alert	Master and Slave Chiller with Same Address	Master and slave chiller have the same CCN address (CCN.A)	Dual chiller routine disabled. Master/slave run as stand-alone chillers.	Automatic	CCN Address for both chillers is the same. Must be different. Check CCN.A under the OPT2 sub-mode in Configuration at both chillers.

See Legend on page 82.

81

Table 44 — Alarm and Alert Codes (cont)

ALARM/ ALERT CODE	ALARM OR ALERT	DESCRIPTION	WHY WAS THIS ALARM GENERATED?	ACTION TAKEN BY CONTROL	RESET METHOD	PROBABLE CAUSE
A207	Alarm	Cooler Freeze Protection	Cooler EWT or LWT is less than Brine Freeze (BR.FZ)	Chiller shutdown. Cooler pump continues to run a minimum of 5 minutes (if control enabled).	Both EWT and LWT must be at least 6 F (3.3 C) above Brine Freeze point (BR.FZ). Automatic for first, Manual reset thereafter.	Faulty thermistor, low water flow, faulty cooler water.
T206	Alert	High Leaving Chilled Water Temperature	LWT is greater than control point and LCW Alert Limit, and capacity is at 100% for one minute.	Alert only. No action taken.	Automatic	Building load greater than unit capacity, or compressor fault. Check for other alarms/alerts.
A208	Alarm	EWT or LWT Thermistor failure	Cooler EWT is less than LWT by 3° F (1.7° C) for 1 minute after a circuit is started	Chiller shutdown. Cooler pump shut off (if control enabled).	Manual	Faulty cooler pump, low water flow, plugged fluid strainer, faulty thermistor.
T300	Alert	Cooler Pump 1 Scheduled Maintenance Due	Pump 1 Service Countdown (P.1.DN) expired. Complete pump 1 maintenance and enter 'YES' for Pump 1 Maintenance Done (P.1.MN) item.	None	Automatic	Routine pump maintenance required
T301	Alert	Cooler Pump 2 Scheduled Maintenance Due	Pump 2 Service Countdown (P.2.DN) expired. Complete pump 2 maintenance and enter 'YES' for Pump 1 Maintenance Done (P.2.MN) item.	None	Automatic	Routine pump maintenance required
T302	Alert	Strainer Blowdown Scheduled Maintenance Due	Strainer Service Countdown (S.T.DN) expired. Complete strainer blowdown and enter 'YES' for Strainer Maintenance Done (S.T.MN) item.	None	Automatic	Routine strainer maintenance required
T303	Alert	Condenser Coil Maintenance Due	Coil Service Countdown (C.L.DN) expired. Complete condenser coil cleaning and enter 'YES' for Coil Maintenance Done (C.L.MN) item.	None	Automatic	Routine condenser coil maintenance required
A412	Alarm	Variable Speed Fan Motor/Drive Failure Alarm	See Table 45 and Table 46	Chiller shut down	Automatic	See Table 45 - HEVCF Common Alarms and Table 46 - HEVCF Alarm/Alert Details, Danfoss Drive
T413	Alert	Variable Speed Fan Motor/Drive Failure Alert	See Table 45 and Table 46	None	Automatic	See Table 45 - HEVCF Common Alarms and Table 46 - HEVCF Alarm/Alert Details, Danfoss Drive
T501	Alert	Current Sensor Board A1 Failure	Alert occurs when CSB output is a constant high value	Compressor A1 shut down	Automatic	CSB failure. Wiring error.
T502	Alert	Current Sensor Board A2 Failure	Alert occurs when CSB output is a constant high value	Compressor A2 shut down	Automatic	CSB failure. Wiring error.
T503	Alert	Current Sensor Board A3 Failure	Alert occurs when CSB output is a constant high value	Compressor A3 shut down	Automatic	CSB failure. Wiring error.
T505	Alert	Current Sensor Board B1 Failure	Alert occurs when CSB output is a constant high value	Compressor B1 shut down	Automatic	CSB failure. Wiring error.
T506	Alert	Current Sensor Board B2 Failure	Alert occurs when CSB output is a constant high value	Compressor B2 shut down	Automatic	CSB failure. Wiring error.
T507	Alert	Current Sensor Board B3 Failure	Alert occurs when CSB output is a constant high value	Compressor B3 shut down	Automatic	CSB failure. Wiring error.
T950	Alert	Loss of Communication with Water System Manager	No communications have been received by the MBB within 5 minutes of last transmission	WSM forces removed. Chiller runs under own control	Automatic	Failed module, wiring error, failed transformer, loose connection plug, wrong address
A951	Alert	Loss of Communication with Chillervisor System Manager	No communications have been received by the MBB within 5 minutes of last transmission	CSM forces removed. Chiller runs under own control	Automatic	Failed module, wiring error, failed transformer, loose connection plug, wrong address

Table 45 — HEVCF Common Alarms

ALARM	DESCRIPTION	PROBABLE CAUSE
A179	Loss of communication with the Danfoss VFD module	Wrong VFD address, damaged communication cable, wiring error, no power to VFD, unresponsive VFD.
A412	Mains phase loss(A4)*	Phase is missing or imbalance is too high on supply side. Check incoming wiring, drive fuses, and incoming power to unit. This is also used for a fault in the input rectifier on the frequency converter.
A412	Inverter Overload(A9)*	Frequency converter has cut out due to excessive current and temperature over a certain time period. Check motors for locked rotor or shorts.
A412	Torque Limit(A12)*	Motor torque limit has been exceeded. Check motor for locked rotor or fan restrictions.
A412	Over Current(A13)*	Inverter peak current limit is exceeded. Check motor for locked rotor or fan restrictions.
A412	Earth (ground) Fault(A14)*	Current exists between output phases and ground. Check motors for short to ground. Check wiring connections at fan motor terminal block at drive.
A412	Short Circuit(A16)*	There is a short circuit in the motor wiring. Find the short circuit and repair.
A412	Control Word Timeout(A17)*	Drive is not communicating with chiller. Check LEN bus wiring connections. Ensure address is set properly.
A412	Heatsink Temp(A29)*	Heatsink has exceeded max temperature. Check drive fan operation and blockage of air-flow to heatsink fins.
A412	Motor Phase U Missing(A30)*	Check load side wiring to motor for missing phase.
A412	Motor Phase V Missing(A31)*	Check load side wiring to motor for missing phase.
A412	Motor Phase W Missing(A32)*	Check load side wiring to motor for missing phase.
A412	Fieldbus Communication Fault(A34)*	Fieldbus on communication card in drive is not working.

*Danfoss Drive Alarm Code.

NOTE: (X) = Dependent on parameter.

LOW SATURATED SUCTION

Several conditions can lead to low saturated suction alarms and the chiller controls have several override modes built in which will attempt to keep the chiller from shutting down. Low fluid flow, low refrigerant charge and plugged filter driers are the main causes for this condition. To avoid permanent damage and potential freezing of the system, do NOT repeatedly reset these alert and/or alarm conditions without identifying and correcting the cause(s).

COMPRESSOR SAFETIES

The 30RAP units with *Comfort*Link controls include a compressor protection board that protects the operation of each of the compressors. Each board senses the presence or absence of current to each compressor.

If there is a command for a compressor to run and there is no current, then one of the following safeties or conditions have turned the compressor off:

Compressor Overcurrent

All compressors have internal line breaks or a motor protection device located in the compressor electrical box.

Compressor Short Circuit

There will not be current if the circuit breaker that provides short circuit protection has tripped.

Compressor Motor Over Temperature

The internal line-break or over temperature switch has opened.

High-Pressure Switch Trip

The high-pressure switch has opened. Below are the factory settings for the fixed high-pressure switch.

30RAP UNIT SIZE	CUTOUT		CUT-IN	
	PSIG	KPA	PSIG	KPA
010-150	650	4482	500	3447

ASTP Protection Trip

All non-digital Copeland compressors are equipped with an advanced scroll temperature protection (ASTP). A label located above the terminal box identifies models that contain this technology. See Fig. 60.

Fig. 60 — Advanced Scroll Temperature Protection Label (010-090)

Advanced scroll temperature protection is a form of internal discharge temperature protection that unloads the scroll compressor when the internal temperature reaches approximately 300°F. At this temperature, an internal bi-metal disk valve opens and causes the scroll elements to separate, which stops compression. Suction and discharge pressures balance while the motor continues to run. The longer the compressor runs unloaded, the longer it must cool before the bi-metal disk resets. See Fig. 61 for approximate reset times.

To manually reset ASTP, the compressor should be stopped and allowed to cool. If the compressor is not stopped, the motor will run until the motor protector trips, which occurs up to 90 minutes later. Advanced scroll temperature protection will reset automatically before the motor protector resets, which may take up to 2 hours.
*Times are approximate.
NOTE: Various factors, including high humidity, high ambient temperature, and the presence of a sound blanket will increase cool-down times.

Fig. 61 — Recommended Minimum Cool Down Time After Compressor Is Stopped*

Motor Overload Protection

COPELAND COMPRESSORS MODELS WITH ELECTRICAL CODE TF (010-090)

Models with a "TF" in the electrical code (i.e., ZP120KCE-**TF**D) have an internal line break motor overload located in the center of the Y of the motor windings. This overload disconnects all three legs of the motor from power in case of an over-current or over-temperature condition. The overload reacts to a combination of motor current and motor winding temperature. The internal overload protects against single phasing. Time must be allowed for the motor to cool down before the overload will reset. If current monitoring to the compressor is available, the system controller can take advantage of the compressor internal overload operation. The controller can lock out the compressor if current draw is not coincident with contactor energizing, implying that the compressor has shut off on its internal overload. This will prevent unnecessary compressor cycling on a fault condition until corrective action can be taken.

COPELAND COMPRESSORS MODELS WITH ELECTRICAL CODE "TW" OR "TE" (010-090) OR DANFOSS COMPRESSOR (100-150)

> ⚠ **CAUTION**
>
> The electronic motor protection module is a safety device that must not be bypassed or compressor damage may result.

Copeland models with "**TW**" or "**TE**" in the electrical code (i.e.,ZP182KCE-**TW**D or ZP182KCE-**TE**D) or Danfoss compressor have a motor overload system that consists of an external electronic control module connected to a chain of four thermistors embedded in the motor windings. The module will trip and remain off for a minimum of 30 minutes if the motor temperature exceeds a preset point to allow the scrolls to cool down after the motor temperature limit has been reached. It may take as long as two hours for the motor to cool down before the overload will reset.

NOTE: Turning off power to the module resets it immediately.

> ⚠ **CAUTION**
>
> Restarting the compressor sooner may cause a destructive temperature buildup in the scrolls.

For this reason, module power must never be switched with the control circuit voltage.

Current sensing boards monitor to the compressor current. The *Comfort*Link control system takes advantage of the compressor overload operation by locking out the compressor if current draw is not detected. This will prevent unnecessary compressor cycling on a fault condition until corrective action can be taken.

Kriwan Motor Protection Module Troubleshooting

Copeland models with a "TW" in the electrical code (i.e., ZP182KCE-**TW**D), have a motor overload system that consists of an external Kriwan electronic control module. These have been replaced by the CoreSense[1] communication module for motor protection. This section is included for reference, and contains instructions for replacing the Kriwan module with the CoreSense module in the field.

Follow the steps listed below to troubleshoot the Kriwan module in the field. See wiring diagram on terminal box cover, or Fig. 62.

---

1. CoreSense is a trademark of Emerson Climate Technologies.

> ⚠ **WARNING**
>
> Do not supply power to unit with compressor cover removed. Failure to follow this warning can cause a fire, resulting in personal injury or death.

> ⚠ **WARNING**
>
> Exercise extreme caution when reading compressor currents when high-voltage power is on. Correct any of the problems described below before installing and running a replacement compressor. Wear safety glasses and gloves when handling refrigerants. Failure to follow this warning can cause fire, resulting in personal injury or death.

> ⚠ **CAUTION**
>
> Do not manually operate contactors. Serious damage to the machine may result.
LEGEND

1 — Kriwan Motor Protection Module Power
2 — Kriwan Control Circuit Connections
3 — Motor Thermal Sensor

Fig. 62 — Kriwan Motor Protection Module

1. De-energize control circuit and module power. Remove the control circuit wires from the module (terminals M1 and M2). Connect a jumper across these control circuit wires. This will bypass the control contact of the module.

> ⚠ **CAUTION**
>
> The motor protection system within the compressor is now bypassed. Use this configuration to temporarily test module only.

2. Re-energize the control circuit and module power. If the compressor will not operate with the jumper installed, then the problem is external to the solid-state protection system. If the compressor operates with the module bypassed but will not operate when the module is reconnected, then the control circuit relay in the module is open. Remove the temporary jumper installed in Step 1.

3. The thermistor protection chain now needs to be tested to determine if the module's control circuit relay is open due to excessive internal temperatures or a faulty component.
   Check the thermistor protection chain located in the compressor as follows:

   a. De-energize control circuit and module power.

   b. Remove the sensor leads from the module (S1 and S2).

c. Measure the resistance of the thermistor protection chain through these sensor leads with an ohm meter.

⚠ CAUTION

Use an ohmmeter with a maximum of 9 volts to check the sensor chain. The sensor chain is sensitive and easily damaged; no attempt should be made to check continuity through it with anything other than an ohmmeter. The application of any external voltage to the sensor chain may cause damage requiring the replacement of the compressor.

d. The diagnosis of this resistance reading is as follows:
- 200 to 2250 ohms: Normal operating range
- 2750 ohms or greater: Compressor overheated. Allow time to cool.
- Zero resistance: Shorted sensor circuit. Replace the compressor.
- Infinite resistance: Open sensor circuit. Replace the compressor.

4. If the resistance reading is abnormal, remove the sensor connector plug from the compressor and measure the resistance at the sensor fusite pins. This will determine if the abnormal reading was due to a faulty connector.

5. On initial start-up, and after any module trip, the resistance of the sensor chain must be below the module reset point before the module circuit will close. Reset values are 2250 to 3000 ohms.

6. If the sensor chain has a resistance that is below 2250 ohms, and the compressor will run with the control circuit bypassed, but will not run when connected properly, the solid-state module is defective and should be replaced. The replacement module must have the same supply voltage rating as the original module.

CoreSense Replacement of Kriwan Motor Protection Module

The Kriwan module has been replaced by the CoreSense communication module for motor protection. Minor wiring changes are required as described below.

⚠ WARNING

Electrical shock can cause personal injury and death. Shut off all power to this equipment during installation and service. There may be more than one disconnect switch. Tag all disconnect locations to alert others not to restore power until work is completed.

⚠ WARNING

Do not supply power to unit with compressor cover removed. Failure to follow this warning can cause a fire, resulting in personal injury or death.

Removing the Kriwan motor protection module:

1. Disconnect and lock out the high voltage and control voltage supply to the unit.

2. Using a straight blade screwdriver, carefully depress the tabs holding the terminal cover to the terminal box to remove the terminal cover. Before proceeding, use a volt meter to verify that the power has been disconnected from the unit.

3. Using wire markers, label the M1, M2, T1, and T2 wires that are connected to the Kriwan module. Using needle nose pliers, remove the M1, M2, T1, T2, S1 and S2 wires from the Kriwan motor protector module.

4. Gently bend the holding tabs holding the Kriwan module in the terminal box and remove the Kriwan module from the terminal box. See Fig. 63.

5. Take note of the S1-S2 plug orientation on the compressor thermistor fusite. Remove the S1-S2 wire harness and plug from the compressor.
Fig. 63 — Kriwan Motor Protection Module Removal

Installing the CoreSense communications module:

1. A new S1-S2 thermistor wiring harness is shipped with the CoreSense kit and must be used. The wiring harness connector block should be fully inserted on the three pins in the orientation shown in Fig. 64 for proper operation.
Fig. 64 — Compressor Motor Sensor Harness Installation

2. Review the DIP switch settings on the CoreSense module. DIP switch no. 1 should be ON (up position) and all other DIP switches should be OFF (down position). See Fig. 65.
Fig. 65 — CoreSense Communication DIP Switch Settings for Kriwan Retrofit

3. Install the CoreSense module in the compressor terminal box as shown in Fig. 66, with the tabs holding the module in place. Route the thermistor wire harness as shown and plug the harness into the 2x2 socket on the CoreSense module.

4. Connect the previously labeled M1, M2, T1, and T2 wires to the appropriate terminals on the CoreSense module.

5. Connect the L1, L2, and L3 phase sensing wires to the L1, L2, and L3 compressor terminal block connections. See the compressor terminal cover diagram for identification of the L1, L2, and L3 terminal block connections.

6. Double-check the installation and make sure all connections are secure. Install the compressor terminal cover.

The CoreSense retrofit is complete and the system can be put back into service.

condition. Alert codes are communicated via a red flashing LED. Alert codes will result in a trip condition and possibly a lockout condition. See wiring diagram on terminal box cover, or Fig. 68. The flash code corresponds to the number of LED flashes, followed by a pause; then the flash code is repeated. A lockout condition produces a red flash, followed by a pause, a solid red, a second pause, and then repeated. Table 48 lists the flash code information for Warning and Alert codes along with code reset and troubleshooting information.

Fig. 66 — CoreSense Communication Module Mounting
Fig. 67 — CoreSense Communication Motor Thermistor Plug

CoreSense Communications Module Troubleshooting

Copeland models with a "TE" in the electrical code (i.e., ZP182KCE**TE**D) have a motor overload system that consists of an external CoreSense communication electronic control module.

Motor thermistors are connected to the CoreSense communication module via a 2x2 plug (Fig. 67).

The CoreSense communications module has field configurable DIP switches for addressing and configuring the module. The DIP switches should be addressed as shown in Table 47.

The CoreSense communication module has a green and a red light-emitting diode (LED). A solid green LED indicates the module is powered and operation is normal. A solid red LED indicates an internal problem with the module. If a solid red LED is encountered, power down the module (interrupt the T1-T2 power) for 30 seconds to reboot the module. If a solid red LED is persistent, change the CoreSense module.

The CoreSense module communicates warning codes via a green flashing LED. Warning codes do not result in a trip or lockout

Fig. 68 — CoreSense Communication Motor Protection Wiring

Table 47 — CoreSense Communication Module DIP Switch Settings

COPELAND ELECTRICAL CODE	DIP SWITCH									
	1	2	3	4	5	6	7	8	9	10

Table 48 — CoreSense Communication Module LED Flash Codes

LED STATUS	FAULT CONDITION	FAULT CODE DESCRIPTION	FAULT CODE RESET	TROUBLESHOOTING INFORMATION
SOLID GREEN	None, normal operation	Module is powered and under normal operation	Not applicable	None
SOLID RED	Module malfunction	Module has an internal fault	Not applicable	1. Reset module by removing power from T1-T2. 2. Replace module.
WARNING LED FLASH				
GREEN FLASH CODE 1	Loss of communication	Module and Master Controller have lost communications with each other for more than 5 minutes	Automatic when communications are re-established	Not Supported. Check DIP Switch settings.
GREEN FLASH CODE 2	Not used	Not applicable	Not applicable	Not applicable
GREEN FLASH CODE 3	Short cycling	Run time of less than 1 minute. Number of short cycles exceeds 48 in a 24-hour period.	Fewer than 48 short cycles in 24 hours	30RAP controls do not allow this operation normally. Confirm proper wiring and DIP switch settings.
GREEN FLASH CODE 4	Open/Shorted Scroll Thermistor	Not applicable	Not applicable	Not applicable
GREEN FLASH CODE 5	Not used	Not applicable	Not applicable	Not applicable
ALERT/LOCKOUT LED FLASH				
RED FLASH CODE 1	High motor temperature	Thermistor resistance greater than 4500 Ω. Lockout occurs after 5 alerts.	Thermistor resistance less than 2750 Ω and 30 minutes have elapsed	1. Check power supply. 2. Check system charge and superheat. 3. Check compressor contactor.
RED FLASH CODE 2	Open/shorted motor thermistor	Thermistor resistance greater than 4500 Ω, or less than 100 Ω. Lockout occurs after 6 hours.	Thermistor resistance is between 100 and 2750 Ω and 30 minutes have elapsed	1. Check for poor connections at module and thermistor fusite. 2. Check continuity of thermistor wiring harness. 3. Check for an open thermistor circuit.
RED FLASH CODE 3	Short cycling	Run time of less than 1 minute. Lockout if the number of alerts exceeds the number configured by the user in 24 hours.	Interrupt power to T2-T1	30RAP controls do not allow this operation normally. Confirm proper wiring.
RED FLASH CODE 4	Scroll high temperature	Not applicable	Not applicable	Not applicable
RED FLASH CODE 5	Not used	Not applicable	Not applicable	Not applicable
RED FLASH CODE 6	Missing phase	Missing phase detected. Lockout after 10 consecutive alerts.	After 5 minutes and missing phase condition is not present	1. Check incoming power. 2. Check fuses or circuit breakers. 3. Check compressor contactor.
RED FLASH CODE 7	Reverse phase	Reverse phase detected. Lockout after 1 alert.	Interrupt power to T2-T1	1. Check incoming power phase sequence 2. Check compressor contactor 3. Check module phase wiring A-B-C.
RED FLASH CODE 8	Not used	Not applicable	Not applicable	Not applicable
RED FLASH CODE 9	Module low voltage	Less than 18 vac supplied to module	After 5 minutes and voltage is between 18 and 30 vac	This alert does not result in a lockout fault. 1. Verify correct 24 vac module is installed. 2. Check for a wiring error.

Warning Codes (Green LED Flash Code):
- Code 1 – Loss of Communication: The module will flash the green Warning LED one time indicating the module has not communicated with the master controller for longer than 5 minutes. Once communication is reinitiated, the Warning will be cleared. The 30RAP units do not support the communication capability of this module.
- Code 2 – Reserved For Future Use
- Code 3 – Short Cycling: The module will flash the green Warning LED three times indicating the compressor has short cycled more than 48 times in 24 hours. A short cycle is defined as compressor runtime of less than 1 minute. The Warning will be activated when the "Short Cycling" DIP Switch (no. 10) is OFF (in the down position). When fewer than 48 short cycles are accumulated in 24 hours the Warning code will be cleared.
- Code 4 – Open/Shorted Scroll Thermistor: The module will flash the green Warning LED four times, indicating that the scroll NTC thermistor has a resistance value that indicates

an open/shorted thermistor. The Warning will be cleared when the resistance value is in the normal range. The 30RAP units do not utilize a scroll thermistor.
- Code 5 – Not used.

Alert/Lockout Codes (Red LED Flash Code):
- Code 1 – Motor High Temperature: The module will flash the red Alert LED one time indicating the motor PTC circuit has exceeded 4500 Ω. A Code 1 Alert will open the M2-M1 contacts. The Alert will reset after 30 minutes and the M2-M1 contacts will close if the resistance of the motor PTC circuit is below 2750 Ω. Five consecutive Code 1 Alerts will lock out the compressor. Once the module has locked out the compressor, a power cycle will be required for the lockout to be cleared.
- Code 2 – Open/Shorted Motor Thermistor: The module will flash the red Alert LED 2 times indicating the motor PTC thermistor circuit has a resistance value greater than 2200 Ω or less than 100 Ω. that indicates an open/shorted thermistor chain. A Code 2 Alert will open the M2-M1 contacts. The

Alert will reset after 30 minutes and the M2-M1 contacts will close if the resistance of the motor PTC circuit is back in the normal range. The module will lock out the compressor if the trip condition exists for longer than 6 hours. Once the module has locked out the compressor, a power cycle will be required to clear the lockout.

- Code 3 – Short Cycling: The module will flash the red Alert LED 3 times indicating the compressor is locked out due to short cycling. A Code 3 Alert will open the M2-M1 contacts. Code 3 will be enabled when the Short Cycling DIP switch (no. 10) is ON (in the up position) and the compressor has exceeded the number of short cycles configured by the user in a 24-hour period. Once the module has locked out the compressor, a power cycle will be required to clear the lockout.
- Code 4 – Scroll High Temperature: The module will flash the red Alert LED 4 times indicating the scroll NTC circuit is less than 2400 Ω. A Code 4 Alert will open the M2-M1 contacts. The Alert will reset after 30 minutes and the M2-M1 contacts will close if the resistance of the scroll NTC circuit is higher than 5100 Ω. The module will lock out the compressor if the number of Code 4 Alerts exceeds the user configurable number of Code 4 events within a 24-hour period. Once the module has locked out the compressor, a power cycle will be required to clear the lockout.
- Code 5 – Not used.
- Code 6 – Missing Phase: The module will flash the red Alert LED 6 times indicating a missing phase in one of the three leads to the compressor. A Code 6 Alert will open the M2-M1 contacts. The Alert will reset after 5 minutes and the M2-M1 contacts will close if the missing phase condition is not present. The module will lock out the compressor after 10 consecutive Code 6 Alerts. Once the module has locked out the compressor, a power cycle will be required to clear the lockout.
- Code 7 – Reverse Phase: The module will flash the red Alert LED 7 times indicating a reverse phase in two of the three leads to the compressor. A Code 7 Alert will open the M2-M1 contacts. The module will lock out the compressor after one Code 7 Alert. A power cycle will be required to clear the lockout.
- Code 8 – Not used.
- Code 9 – Module Low Voltage: The module will flash the red Alert LED 9 times indicating low module voltage, less than 18 vac on the T2-T1 terminals for more than 5 seconds. A Code 9 Alert will open the M2-M1 contacts. The Alert will reset after 5 minutes and the M2-M1 contacts will close if the T2-T1 voltage is above the reset value in 18 to 30 vac.

Resetting Alert codes can be accomplished manually by cycling power to the module (disconnect T2 or T1 for 5 seconds). If the fault that initiated the Alert code is absent after the reset is performed, the Alert code will be cleared and CoreSense module will allow normal operation. If the fault is still present after the reset is performed, the fault code will continue to be displayed via the green or red flashing LED.

Troubleshooting procedures described for the Kriwan module section (page 86) are applicable to the CoreSense communication module.

Copeland replacement compressors are shipped with two solid-stage motor protection modules. A 120/240-volt module is installed and a 24-volt module is shipped with the compressor. The 30RAP units require the 24-volt module be field installed. Failure to install the 24-volt module will result in a compressor failure alarm. See Fig. 69.
Fig. 69 — Solid-State Motor Protection Module

Danfoss Electronic Module Replacement of Kriwan Motor Protection Module

The Kriwan module has been replaced by the Danfoss communication module for motor protection on all Danfoss compressors.

Motor Overheating and Overloading — The motor protector comprises a control module and PTC sensors embedded in the motor winding. The close contact between thermistors and windings ensures a very low level of thermal inertia.

The motor temperature is constantly measured by a PTC thermistor loop connected on S1-S2. If the thermistor exceeds its response temperature, its resistance increases above the trip level (4,500 Ω) and the output relay then trips; i.e., contacts M1-M2 are open. After cooling to below the response temperature (resistance < 2,750 Ω), a 5-minute time delay is activated.

After this delay has elapsed, the relay is once again pulled in; i.e., contacts M1-M2 are closed. The time delay may be canceled by means of resetting the mains (L-N-disconnect) for approximately 5 seconds.

A red/green twin LED is visible on the module. A solid green LED denotes a fault-free condition. A blinking red LED indicates an identifiable fault condition. See Fig. 70 and 71.
Fig. 70 — PTC Overheat
Fig. 71 — PTC Reset Delay Active
(after PTC Overheat)

Phase Loss, Phase Sequence — The electronic module provides protection against phase reversal and phase loss at start-up.

The circuit should be thoroughly checked in order to determine the cause of the phase problem before re-energizing the control circuit. The phase sequencing and phase loss monitoring functions are active during a 5-second window 1 second after the compressor start-up (power on L1-L2-L3). See Fig. 72.
Fig. 72 — Phase Sequence Module Logic

Should one of these parameters be incorrect, the relay would lock out (contact M1-M2 [or 11-14] open). The red LED on the module will show the following blink code (Fig. 73 and 74).
Fig. 73 — In Case of Phase Loss Error

Fig. 74 — In Case of Phase Reverse Error

The lockout may be canceled by resetting the power mains (disconnect L-N) for approximately 5 seconds.

Internal Module Failure Protection — An internal microprocessor fault leads to trip; relay contacts M1-M2 open.

Fault Diagnosis — If the relay contacts M1-M2 are open, carry out the following steps:

1. Check all electrical connections (wiring, drawing conformity, connection tightness, etc.)

2. Try to reset by interrupting mains supply to the module for at least 5 seconds.

   If, after reset, the relay contacts M1-M2 are closed, a fault in motor power supply or high motor temperature caused a trip condition (missing phase, wrong phase sequence, operating outside of the compressor operating envelope, etc.).

   If the relay contacts M1-M2 remain open:

   a. Disconnect the PTC thermistor leads and measure the resistance value at this point (max measurement voltage 3V).

      • R=∞: PTC loop opened; remove compressor.

      • R>2750Ω: wait until compressor motor winding temperature has cooled down, then reconnect PTC and try to reset; check root causes of motor overheating (operation outside of working envelope, etc.).

      • 150Ω<R<1250Ω: normal resistance value for PTC at ambient temperature; continue with step 2.b.

      • R=0Ω: PTC loop in short circuit; replace the compressor.

   b. Test the module itself within the terminal box:

      • Disconnect L-N.

      • Disconnect S1-S2.

      • Disconnect M1-M2.

      • Reconnect mains supply L-N.

      • Bridge S1-S2.

      • Try to reset by interrupting mains supply to the module for at least 5 seconds.

      • Check relay contacts M1-M2 with ohmmeter.

         • If the relay contacts M1-M2 are closed, module is okay.

- If the relay contacts M1-M2 are still open, replace the module.

High Discharge Gas Temperature Protection

Units equipped with digital compressors have an additional thermistor located on the discharge line. If discharge temperature exceeds 265°F (129.4°C), the digital compressor will be shut off.

Alarms will also occur if the current sensor board malfunctions or is not properly connected to its assigned digital input. If the compressor is commanded OFF and the current sensor reads ON, an alert is generated. This will indicate that a compressor contactor has failed closed. In this case, a special mode, Compressor Stuck on Control, will be enabled and all other compressors will be turned off. An alarm will then be enabled to indicate that service is required. Outdoor fans will continue to operate. The first outdoor fan stage is turned on immediately. The other stages of fan will be turned on as required by SCT.

Alarms and Alerts

These are warnings of abnormal or fault conditions, and may cause either one circuit or the whole unit to shut down. They are assigned code numbers as described in Table 44.

If the unit is in alarm and unable to operate, Control Mode (STAT) = 4 (Off Emrgcy).

Automatic alarms will reset without operator intervention if the condition corrects itself. The following method must be used to reset manual alarms:

Before resetting any alarm, first determine the cause of the alarm and correct it. Enter the Alarms mode indicated by the LED on the side of the scrolling marquee display. Press ENTER and ▼ until the sub-menu item RCRN "RESET ALL CURRENT ALARMS" is displayed. Press ENTER. The control will prompt the user for a password, by displaying PASS and WORD. Press ENTER to display the default password, 1111. Press ENTER for each character. If the password has been changed, use the arrow keys to change each individual character. Toggle the display to "YES" and press ENTER. The alarms will be reset.

COMPRESSOR FAILURE ALERTS

T051, T052, T053 (Circuit A Compressor Failures)
T055, T056, T057 (Circuit B Compressor Failures)

Alert codes T051-T053 are for compressors A1-A3, respectively, and T055-T057 are for compressors B1-B3, respectively. These alerts occur when the current sensor (CS) does not detect compressor current during compressor operation. When this occurs, the control turns off the compressor.

If the current sensor board reads OFF while the compressor relay has been commanded ON, an alert is generated.

POSSIBLE CAUSES

Compressor Overload

Either the compressor internal overload protector is open or the external overload protector (Kriwan module) has activated. The external overload protector modules are mounted in the compressor wiring junction box. Temperature sensors embedded in the compressor motor windings are the inputs to the module. The module is powered with 24 vac from the units main control box. The module output is a normally closed contact that is wired in series with the compressor contactor coil. In a compressor motor overload condition, contact opens, deenergizing the compressor contactor.

Low Refrigerant Charge

If the compressor operates for an extended period of time with low refrigerant charge, the compressor ASTP device will open, which will cause the compressor to trip on its overload protection device.

Circuit Breaker Trip

The compressors are protected from short circuit by a breaker in the control box.

Wiring Error

A wiring error might not allow the compressor to start.

To check out alerts T051-T057:

1. Turn on the compressor in question using Service Test mode. If the compressor does not start, then most likely the problem is one of the following: HPS open, open internal protection, circuit breaker trip, incorrect safety wiring, or incorrect compressor wiring.

2. If the compressor does start, verify it is rotating in the correct direction.

> IMPORTANT: Prolonged operation in the wrong direction can damage the compressor. Correct rotation can be verified by a gage set and looking for a differential pressure rise on start-up.

> IMPORTANT: If the CS is always detecting current, verify that the compressor is on. If the compressor is on, check the contactor and the relay on the MBB. If the compressor is off and there is no current, verify the CSB wiring and replace if necessary.

> IMPORTANT: Return to Normal mode and observe compressor operation to verify that compressor current sensor is working and condenser fans are energized.

COMPRESSOR STUCK ON FAILURE ALARMS

Circuit A A051, A052, A053
Circuit B A055, A056, A057

Alarm codes A051, A052, A053, A055, A056, and A057 are for compressors A1, A2, A3, B1, B2, and B3. These alarms occur when the CSB detects current when the compressor should be off. When this occurs, the control turns off the compressor.

If the current sensor board reads ON while the compressor relay has been commanded OFF for a period of 4 continuous seconds, an alarm is generated. These alarms are only monitored for a period of 10 seconds after the compressor relay has been commanded OFF. This is done to facilitate a service technician forcing a relay to test a compressor.

In addition, if a compressor stuck failure occurs and the current sensor board reports the compressor and the request off, certain diagnostics will take place as follows:

1. If any of the compressors are diagnosed as stuck on and the current sensor board is on and the request is off, the control will command the condenser fans to maintain normal head pressure.

2. The control will shut off all other compressors.

   The possible causes include welded contactor or frozen compressor relay on the MBB.

   To check out alarms A051-A057:

1. Place the unit in Service Test mode. All compressors should be off.

2. Verify that there is not 24 v at the contactor coil. If there is 24 v at the contactor, check relay on MBB and wiring.

3. Check for welded contactor.

4. Verify CSB wiring.

5. Return to Normal mode and observe compressor operation to verify that compressor current sensor is working and condenser fans are energized.

Circuit A A051, A052, A053 (Chattering Failure)

Circuit B A055, A056, A057 (Chattering Failure) — Alarm codes A051, A052, A053 are for compressors A1, A2, and A3: A055, A056, and A057 are for compressors B1, B2, and B3. The compressor is commanded ON. If the compressor feedback indicates a feedback regular expression of 11*00*11*0 during any given 16-sec. time period, the alert is tripped. In

regular expression notation X* means any number of occurrences of X (including 0 occurrences). For the expression 11*00*11*0, read as at least 1 ON state, followed by at least 1 OFF state, followed by at least one ON state, followed by one OFF state. (In the given expression, 1 is ON, 0 is OFF.) When this occurs, the control turns off the compressor and a manual reset is required.

POSSIBLE CAUSES

Typically this failure will indicate that the high pressure switch (HPS) is chattering. The HPS is in series with the 24 VAC that is providing power to the on-board relay (which in turn is powering the coil of the compressor contactor). It is possible for the HPS to reset faster than the control can detect it reliably (without experiencing nuisance trips), thus the need for chattering compressor logic. Note that the HPS also has chattering logic applied to it.

A060 (Cooler Leaving Fluid Thermistor Failure) — If the sensor reading is outside the range of –40 to 245°F (–40 to 118°C) then the alarm will occur. The cause of the alarm is usually a faulty thermistor, a shorted or open thermistor caused by a wiring error, or a loose connection. Failure of this thermistor will shut down the entire unit.

A061 (Cooler Entering Thermistor Failure) — If the sensor reading is outside the range of –40 to 240°F (–40 to116°C) then the alarm will occur. The cause of the alarm is usually a faulty thermistor, a shorted or open thermistor caused by a wiring error, or a loose connection. Failure of this thermistor will shut down the entire unit.

T068, T069 (Circuit A,B Compressor Return Gas Temperature Thermistor Failure) — This alert occurs when the compressor return gas temperature sensor is outside the range of –40 to 240°F (–40 to 116°C). Failure of this thermistor will shut down the appropriate circuit.

T073 (Outside Air Temperature Thermistor Failure) — This alert occurs when the outside air temperature sensor is outside the range of –40 to 240°F (–40 to 116°C). Failure of this thermistor will disable any elements of the control which require its use.

T074 (Space Temperature Thermistor Failure) — This alert occurs when the space temperature sensor is outside the range of –40 to 245°F (–40 to 118°C). Failure of this thermistor will disable any elements of the control which requires its use. The cause of the alert is usually a faulty thermistor in the T55 or T58 device, a shorted or open thermistor caused by a wiring error, or a loose connection.

T077 (Circuit A Saturated Suction Temperature exceeds Cooler Leaving Fluid Temperature)

T078 (Circuit B Saturated Suction Temperature exceeds Cooler Leaving Fluid Temperature) — Alert codes T077 and T078 occur when a compressor in a circuit has been running and the saturated suction temperature is greater than the cooler leaving water temperature for 5 minutes. The alert is generated and the circuit is shut down. The alert automatically resets when the saturated suction temperature is less than the leaving water temperature minus 1°F (0.5°C).

T090 (Circuit A Discharge Pressure Transducer Failure)

T091 (Circuit B Discharge Pressure Transducer Failure) — Alert codes T090 and T091 are for circuits A and B, respectively. These alerts occur when the pressure is outside the range of 0.0 to 667.0 psig. A circuit cannot run when this alert is active. Use the scrolling marquee to reset the alert. The cause of the alert is usually a faulty transducer, faulty 5-v power supply, or a loose connection.

T092 (Circuit A Suction Pressure Transducer Failure)

T093 (Circuit B Suction Pressure Transducer Failure) — Alert codes T092 and T093 are for circuits A and B, respectively. These alerts occur when the pressure is outside the range of 0.0 to 420.0 psig. A circuit cannot run when this alert is active. Use the scrolling marquee to reset the alert. The cause of the alert is usually a faulty transducer, faulty 5-v power supply, or a loose connection.

T094 (Discharge Gas Thermistor Failure) — This alert occurs for units which have the digital compressor installed on circuit A. If discharge gas temperature is open or shorted, the circuit will be shut off. The alert will reset itself when discharge temperature is less than 250 F (121.1 C). The cause of the alert is usually low refrigerant charge or a faulty thermistor.

T110 (Circuit A Loss of Charge)

T111 (Circuit B Loss of Charge) — Alert codes T110 and T111 are for circuits A and B, respectively. These alerts occur when the compressor is OFF and the discharge pressure is less than 26 psig.

T112 (Circuit A High Saturated Suction Temperature)

T113 (Circuit B High Saturated Suction Temperature) — Alert codes T112 and T113 occur when compressors in a circuit have been running for at least 5 minutes and the circuit saturated suction temperature is greater than 70 F (21.1 C). The high saturated suction alert is generated and the circuit is shut down.

T114 (Circuit A Low Suction Superheat)

T115 (Circuit B Low Suction Superheat) — Alert codes T114 and T115 occur when the superheat of a circuit is less than 5°F (2.8 C) for 5 continuous minutes. The low superheat alert is generated and the circuit is shut down.

T116 (Circuit A Low Cooler Suction Temperature)

T117 (Circuit B Low Cooler Suction Temperature) — Alert codes T116 and T117 are for circuits A and B, respectively. These alerts are generated if the capacity stages are reduced three times without a 30 minute interval between capacity reductions due to operating mode 7 or mode 8.

T118 (High Discharge Gas Temperature Alert)

A118 (High Discharge Gas Temperature Alarm) — This alert or alarm occurs for units which have the digital compressor installed on circuit A. If discharge gas temperature is greater than 268°F (131.1°C), the circuit will be shut off. The alert will reset itself when discharge temperature is less than 250°F (121.1°C). If this alert occurs 3 times within a day, the A118 alarm will be generated and the alarm must be reset manually. The cause of the alert is usually low refrigerant charge or a faulty thermistor.

T126 (Circuit A High Head Pressure)

T127 (Circuit B High Head Pressure) — Alert codes T126 and T127 are for circuits A and B, respectively. These alerts occur when the appropriate saturated condensing temperature is greater than the operating envelope shown in Fig. 28 or 29. Prior to the alert, the control will shut down one compressor on a circuit if that circuit's saturated condensing temperature is greater than the maximum SCT minus 5°F (2.7°C). If SCT continues to rise to greater than the maximum SCT, the alert will occur and the circuit's remaining compressor will shut down. The cause of the alarm is usually an overcharged system, high outdoor ambient temperature coupled with dirty outdoor coil, non-condensables, faulty condenser fan motor, plugged filter drier, or a faulty high-pressure switch.

T133 (Circuit A Low Suction Pressure)

T134 (Circuit B Low Suction Pressure) — Alert codes T133 and T134 are for circuits A and B, respectively. These alerts are generated if one of the two following conditions is satisfied: the circuit suction pressure is below 34 psig (234.4 kPa) for 8 seconds, or the suction pressure is below 23 psig (158.6 kPa). The cause of this alert may be low refrigerant charge, plugged liquid line filter drier, or sticking EXV. Check head pressure operation. If not equipped, consider adding low ambient temperature head pressure control.

Add wind baffles if required.

A140 (Reverse Rotation Detected) — A test is made once, when compressor is energized, for suction pressure change on the first activated circuit. The unit control determines failure as follows:

1. The suction pressure of both circuits is sampled 5 seconds before the compressor is brought on, right when the compressor is brought on, and 5 seconds afterwards.

2. The rate of suction pressure change from 5 seconds before the compressor is brought on to when the compressor is brought on is calculated.

3. The rate of suction pressure change from when the compressor is brought on to 5 seconds afterwards is calculated.

4. With the above information, the test for reverse rotation is made. If the suction pressure change 5 seconds after compression is greater than the suction pressure change 5 seconds before compression – 1.25, then there is a reverse rotation error.

This alarm will disable mechanical cooling and will require manual reset.

A150 (Unit is in Emergency Stop) — If the CCN emergency stop command is received, the alarm is generated and the unit will be immediately stopped.

If the CCN point name "EMSTOP" in the system table is set to emergency stop, the unit will shut down immediately and broadcast an alarm back to the CCN, indicating that the unit is down. This alarm will clear when the variable is set back to "enable."

A151 (Illegal Configuration) — An A151 alarm indicates an invalid configuration has been entered. The following are illegal configurations.

- Invalid unit size has been entered.
- Fluid is water with ICE making configured.
- Incorrect AUX board installed with Motormaster configured (AUX 1 must be used).
- Incorrect AUX software version (must be 3.0 or higher).

A152 (Unit Down Due to Failure) — Both circuits are off due to alerts and/or alarms. Reset is automatic when all alarms are cleared. This alarm indicates the unit is at 0% capacity.

T153 (Real Time Clock Hardware Failure) — A problem has been detected with MBB real time clock hardware. Try resetting the power and check the indicator lights. If the alarm continues, the board should be replaced.

A154 (Serial EEPROM Hardware Failure) — A problem has been detected with the EEPROM on the MBB. Try resetting the power and check the indicator lights. If the alarm continues, the board should be replaced.

T155 (Serial EEPROM Storage Failure Error) — A problem has been detected with the EEPROM storage on the MBB. Try resetting the power and check the indicator lights. If the alert continues, the board should be replaced.

A156 (Critical Serial EEPROM Storage Failure Error) — A problem has been detected with the EEPROM storage on the MBB. Try resetting the power and check the indicator lights. If the alarm continues, the board should be replaced.

A157 (A/D Hardware Failure) — A problem has been detected with A/D conversion on the boards. Try resetting the power and check the indicator lights. If the alarm continues, the board should be replaced.

T170 (Loss of Communication with the Compressor Expansion Module) —This alert indicates that there are communications problems with the compressor expansion module. All functions performed by the CXB will stop. The alarm will automatically reset.

A172 (Loss of Communication with the EXV Board) — This alarm indicates that there are communications problems with the EXV board. The alarm will automatically reset.

T173 (Energy Management Module Communication Failure) — This alert indicates that there are communications problems with the energy management. All functions performed by the EMM will stop, which can include demand limit, reset and capacity input. The alarm will automatically reset.

T174 (4 to 20 mA Cooling Set Point Input Failure) — This alert indicates a problem has been detected with cooling set point 4 to 20 mA input. The input value is either less than 2 mA or greater than 22 mA.

T175 (Loss of Communication with the AUX Board) — This alarm indicates that there are communications problems with the AUX board. All functions performed by the AUX board will stop, which can include digital scroll unloader operation and low ambient head pressure control. The alarm will automatically reset.

T176 (4 to 20 mA Reset Input Failure) — This alert indicates a problem has been detected with reset 4 to 20 mA input. The input value is either less than 2 mA or greater than 22 mA. The reset function will be disabled when this occurs.

T177 (4 to 20 mA Demand Limit Input Failure) — This alert indicates a problem has been detected with demand limit 4 to 20 mA input. The input value is either less than 2 mA or greater than 22 mA. The reset function will be disabled when this occurs.

A179 (Fan VFD Communication Failure) — This alarm indicates that there are communications problems between MBB and fan VFD. When this alarm occurs, the chiller will shut down. Reset is automatic when all alarms are cleared.

A189 (Cooler Pump Auxiliary Contacts Inputs Miswired) — This alarm indicates that Pump 1 auxiliary contacts are closed when Pump 2 output is energized or Pump 2 auxiliary contacts are closed when Pump 1 output is energized. When this alarm occurs, both pump outputs are turned off. Reset is automatic when all alarms are cleared.

T190 (Cooler Pump 1 Aux Contacts Failed to Close at Start-Up) — This alert indicates that Pump 1 auxiliary contacts did not close within 26 seconds after Pump 1 was started. When this alert occurs, Pump 1 will be turned off. Pump 2 will be started if available. Manual reset is required for this alert.

T191 (Cooler Pump 2 Aux Contacts Failed to Close at Start-Up) — This alert indicates that Pump 2 auxiliary contacts did not close within 26 seconds after Pump 2 was started. When this alert occurs, Pump 2 will be turned off. Pump 1 will be started if available. Manual reset is required for this alert.

T192 (Cooler Pump 1 Failed to Provide Flow at Start-Up) — This alert indicates that Pump 1 did not provide flow to close flow switch within 60 seconds after Pump 1 was started. When this alert occurs, Pump 1 will be turned off. Pump 2 will be started if available. Manual reset is required for this alert.

T193 (Cooler Pump 2 Failed to Provide Flow at Start-Up) — This alert indicates that Pump 2 did not provide flow to close flow switch within 60 seconds after Pump 2 was started. When this alert occurs, Pump 2 will be turned off. Pump 1 will be started if available. Manual reset is required for this alert.

T194 (Cooler Pump 1 Aux Contacts Opened During Normal Operation) — This alert indicates that Pump 1 auxiliary contacts open for 26 seconds after initially made. When this alert occurs, all compressors shut down and Pump 1 will be turned off. Pump 2 will be started if available. Chiller will be allowed to run if Pump 2 starts successfully. Manual reset is required for this alert.

T195 (Cooler Pump 2 Aux Contacts Opened During Normal Operation) — This alert indicates that Pump 2 auxiliary contacts open for 26 seconds after initially made. When this alert occurs, all compressors shut down and Pump 2 will be turned off. Pump 1 will be started if available. Chiller will be allowed to run if Pump 1 starts successfully. Manual reset is required for this alert.

T196 (Flow Lost While Pump 1 Running) — This alert indicates that cooler flow switch contacts open for 3 seconds after initially made, when Pump 1 is running. When this alert occurs, all compressors shut down and Pump 1 will be turned off. Pump 2 will be started if available. Chiller will be allowed to run if Pump 2 starts successfully. Manual reset is required for this alert.

T197 (Flow Lost While Pump 2 Running) — This alert indicates that cooler flow switch contacts open for 3 seconds after initially made, when Pump 2 is running. When this alert occurs, all compressors shut down and Pump 2 will be turned off. Pump 1 will be started if available. Chiller will be allowed to run if Pump 1 starts successfully. Manual reset is required for this alert.

A198 (Cooler Pump 1 Aux Contacts Closed While Pump Off) — This alert indicates that Pump 1 auxiliary contacts closed for 2 minutes when pump state is off. When this alarm occurs, chiller is not allowed to start. Manual reset is required for this alarm, when aux contact becomes open.

A199 (Cooler Pump 2 Aux Contacts Closed While Pump Off) — This alert indicates that Pump 2 auxiliary contacts closed for 2 minutes when pump state is off. When this alarm occurs, Chiller is not allowed to start. Manual reset is required for this alarm, when aux contact becomes open.

P200 — Cooler Flow/Interlock Contacts Failed to Close at Start-Up Pre-Alert

A200 — Cooler Flow/Interlock Contacts Failed to Close at Start-Up Alarm — These alarms will occur if the cooler flow switch/cooler pump interlock contacts failed to close within 1 minute after start-up, if cooler pump control is enabled; or within 5 minutes after start-up, if cooler pump control is not enabled. If the unit is equipped with dual pumps, the second pump will be started and time allowed to prove flow before the unit is alarmed. When this alarm occurs, the chiller is not allowed to start. The alarm will require manual reset.

If this condition is encountered, check the following items:

- chilled water flow switch, for proper operation
- flow switch cable, for power and control
- chilled water loop to be sure that it is completely filled with water, and all air has been purged
- chilled water pump interlock circuit, for proper operation
- pump electrical circuit for power
- pump circuit breaker
- pump contactor, for proper operation
- chilled water pump, for proper operation; look for overload trips
- chilled water strainer for a restriction
- all isolation valves are open completely

P201 — Cooler Flow/Interlock Contacts Opened During Normal Operation Pre-Alert

A201 — Cooler Flow/Interlock Contacts Opened During Normal Operation Alarm — If the chilled water flow switch opens for at least three (3) seconds after initially being closed, a P201 — Cooler Flow/Interlock Contacts Opened During Normal Operation Pre-Alert will be generated for the appropriate pump and the machine will stop. If available, the other pump will be started. If flow is proven, the machine will be allowed to restart. If after 5 minutes, the cooler flow switch/interlock contacts do not close, the alarm will change to an A201 — Cooler Flow/Interlock Contacts Opened During Normal Operation Alarm.

When this alarm occurs, the chiller will be shut down. The pre-alert (P201) will be reset automatically; the alarm (A201) will require manual reset.

Possible Causes:

If this condition is encountered, check the following items:

- chilled water flow switch, for proper operation.
- flow switch cable, for power and control.
- chilled water loop to be sure that it is completely filled with water, and all air has been purged.
- chilled water pump interlock circuit for proper operation.

In units that do not control the chilled water pump, check the Cooler Pump Shutdown Delay (*Configuration→OPT1→PM.DY*). The factory default is set to one minute. If the unit is signaled to stop and the pumps are shutdown shortly after the command, this alarm may trigger. Try setting the delay to 0. Look at the system operation sequence to be sure that the unit has enough time to shut down, before the chilled water flow stops. Check the following items:

- pump electrical circuit for power.
- pump circuit breaker.
- pump contactor, for proper operation.
- chilled water pump for proper operation; look for overload trips.
- chilled water strainer for a restriction.
- all isolation valves are open completely.

A202 (Cooler Pump Interlock Closed When Pump is Off) — This alarm indicates that if the chiller is configured for cooler pump control, the flow switch input is closed for 5 minutes while the pump outputs are off. When this alarm occurs, the chiller will shut down. Reset is automatic when auxiliary contact becomes open.

T203 (Loss of Communication with Slave Chiller) — This alert indicates that the master chiller MBB loses communication with the slave chiller MBB. When this alert occurs, dual chiller routine will be disabled; Master/Slave will run as stand-alone chillers. Reset is automatic when all alerts are cleared.

T204 (Loss of Communication with Master Chiller) — This alert indicates that the slave chiller MBB loses communication with the master chiller MBB. When this alert occurs, dual chiller routine will be disabled; Master/Slave will run as stand-alone chillers. Reset is automatic when all alerts are cleared.

T205 (Master and Slave Chiller with Same Address) — This alert indicates that the master and slave chiller have the same CCN address (*CCN.A*). When this alert occurs, dual chiller routine will be disabled; Master/Slave will run as stand-alone chillers. Reset is automatic when all alerts are cleared.

T206 — High Leaving Chilled Water Temperature Alert — This alert will be generated if the unit is at 100% capacity for at least 60 seconds and the Leaving Water Temperature, **LWT** (*Run Status→VIEW*) is greater than the Control Point, **CTPT** (*Run Status→VIEW*) plus the High Leaving Chilled Water Alert Limit, **LCWT** (*Configuration→OPT2*).

LWT > CTPT + LCWT

LCWT is field selectable from 2 to 60 ΔF (1.1 to 33.3 ΔC) and is defaulted at 60 ΔF (33.3 ΔC).

The unit will not generate this alert if Capacity, **CAP** (*Run Status→VIEW*) is less than 100%. If the unit's available capacity is less than 100%, this alert will not be generated.

No action will be taken; this is an alert only.

This alert will reset automatically if one of two conditions is met:

1. If the Leaving Water Temperature, **LWT** (*Run Status→VIEW*) is less than the Control Point, **CTPT** (*Run Status→VIEW*) plus the High Leaving Chilled Water Alert Limit, **LCWT** (*Configuration→OPT2*) minus 5°F (2.8°C).

   LWT < CTPT + LCWT – 5°F (2.8°C)

2. If the Leaving Water Temperature, **LWT** (*Run Status→VIEW*) is less than the Control Point, **CTPT** (*Run Status→VIEW*).

   LWT < CTPT

If this condition is encountered, check to be sure building load does not exceed unit capacity.

A207 (Cooler Freeze Protection) — This alarm indicates that cooler EWT or LWT is less than Brine Freeze (*BR.FZ*). When this alarm occurs, chiller will shut down; the cooler pump will continue to run a minimum of 5 minutes if control enabled. Both EWT and LWT must be at least 6°F (3.3°C) above the brine freeze point (*BR.FZ*) to clear the alarm. The alarm will be cleared automatically for the first time, then manual reset will be required thereafter.

A208 (EWT or LWT Thermistor Failure) — This alarm indicates that cooler EWT is less than LWT by 3°F for one minute after a circuit is started. When this alarm occurs, chiller will shut

down; the cooler pump will shut off if control enabled. Manual reset will be required for this alarm.

T300 (Cooler Pump 1 Scheduled Maintenance Due) — This alert indicates that Pump 1 Service Countdown (*P.1.DN*) expired. Complete Pump 1 maintenance and enter "YES" for Pump 1 Maintenance Done (*P.1.MN*) item to clear the alert. Reset is automatic when all alerts are cleared.

T301 (Cooler Pump 2 Scheduled Maintenance Due) — This alert indicates that Pump 2 Service Countdown (*P.2.DN*) expired. Complete Pump 2 maintenance and enter "YES" for Pump 2 Maintenance Done (*P.2.MN*) item to clear the alert. Reset is automatic when all alerts are cleared.

T302 (Strainer Blowdown Scheduled Maintenance Due) — This alert indicates that Strainer Service Countdown (*S.T.DN*) expired. Complete the strainer blowdown maintenance and enter "YES" for Strainer Maintenance Done (*S.T.MN*) item to clear the alert. Reset is automatic when all alerts are cleared.

T303 (Condenser Coil Maintenance Due) — This alert indicates that Coil Service Countdown (*C.L.DN*) expired. Complete the condenser coil cleaning and enter "YES" for Coil Maintenance Done (*C.L.MN*) item to clear the alert. Reset is automatic when all alerts are cleared.

A412 (Variable Speed Fan Motor/Drive Failure) — This alarm indicates that there is a variable speed fan motor/VFD related alarm. See Tables 44 and 45 for details. When this alarm occurs, chiller will shut down, or is not allowed to start. Reset is automatic when all alarms are cleared.

T413 (Variable Speed Fan Motor/Drive Failure) — This alert indicates that there is a variable speed fan motor/VFD related alert See Tables 44 and 45 for details. When this alert occurs, there is no impact to normal chiller operation. Reset is automatic when all alerts are cleared.

T501, T502, T503 (Current Sensor Board Failure — A xx Circuit A)

T505, T506, T507 (Current Sensor Board Failure — B xx Circuit B) — Alert codes T501-T503 are for compressors A1-A3, respectively, and T505-T507 are for compressors B1-B3, respectively. These alerts occur when the output of the CSB is a constant high value. These alerts reset automatically. If the problem cannot be resolved, the CSB must be replaced.

T950 (Loss of Communication with Water System Manager) — This alert indicates that no communications have been received by the MBB within 5 minutes of last transmission. When this alert occurs, WSM forces will be removed and chiller will run under its own control. Reset is automatic when all alerts are cleared.

A951 (Loss of Communication with Chillervisor System Manager) — This alarm indicates that no communications have been received by the MBB within 5 minutes of last transmission. When this alarm occurs, CSM forces will be removed and chiller will run under its own control. Reset is automatic when all alarms are cleared.

*Identified by 12th digit in unit model number.

APPENDIX D — BACNET COMMUNICATION

The following section is used to configure the UPC Open controller which is used when the BACnet[1] communication option is selected. The UPC Open controller is mounted in the main control box per unit components arrangement diagrams.

TO ADDRESS THE UPC OPEN CONTROLLER

The user must give the UPC Open controller an address that is unique on the BACnet network. Perform the following procedure to assign an address:

1. If the UPC Open controller is powered, pull the screw terminal connector from the controller's power terminals labeled Gnd and HOT. The controller reads the address each time power is applied to it.

2. Using the rotary switches (see Fig. A and B), set the controller's address. Set the Tens (10's) switch to the tens digit of the address, and set the Ones (1's) switch to the ones digit.

As an example in Fig. B, if the controller's address is 25, point the arrow on the Tens (10's) switch to 2 and the arrow on the Ones (1's) switch to 5.

1. BACnet is a registered trademark of ASHRAE (American Society of Heating, Refrigerating, and Air-Conditioning Engineers).
Fig. B — Address Rotary Switches

BACNET DEVICE INSTANCE ADDRESS

The UPC Open controller also has a BACnet Device Instance address. This Device Instance MUST be unique for the complete BACnet system in which the UPC Open controller is installed. The Device Instance is auto generated by default and is derived by adding the MAC address to the end of the Network Number. The Network Number of a new UPC Open controller is 16101, but it can be changed using i-Vu® Tools or BACView device. By default, a MAC address of 20 will result in a Device Instance of 16101 + 20 which would be a Device Instance of 1610120.

Fig. A — UPC Open Controller

CONFIGURING THE BAS PORT FOR BACNET MS/TP

Use the same baud rate and communication settings for all controllers on the network segment. The UPC Open controller is fixed at 8 data bits, No Parity, and 1 Stop bit for this protocol's communications.

If the UPC Open controller has been wired for power, pull the screw terminal connector from the controller's power terminals labeled Gnd and HOT. The controller reads the DIP Switches and jumpers each time power is applied to it.

Set the BAS Port DIP switch DS3 to "enable." Set the BAS Port DIP switch DS4 to "E1-485." Set the BMS Protocol DIP switches DS8 through DS5 to "MSTP." See Table A.

Table A — SW3 Protocol Switch Settings for MS/TP

DS8	DS7	DS6	DS5	DS4	DS3
Off	Off	Off	Off	On	Off

Verify that the EIA-485 jumpers below the CCN Port are set to EIA-485 and 2W.

The example in Fig. C shows the BAS Port DIP Switches set for 76.8k (Carrier default) and MS/TP.

Set the BAS Port DIP Switches DS2 and DS1 for the appropriate communications speed of the MS/TP network (9600, 19.2k, 38.4k, or 76.8k bps). See Fig. C and Table B.

Table B — Baud Selection Table

BAUD RATE	DS2	DS1
9,600	Off	Off
19,200	On	Off
38,400	Off	On
76,800	On	On

WIRING THE UPC OPEN CONTROLLER TO THE MS/TP NETWORK

The UPC Open controller communicates using BACnet on an MS/TP network segment communications at 9600 bps, 19.2 kbps, 38.4 kbps, or 76.8 kbps.
Fig. C — DIP Switches

Wire the controllers on an MS/TP network segment in a daisy-chain configuration. Wire specifications for the cable are 22 AWG (American Wire Gage) or 24 AWG, low-capacitance, twisted, stranded, shielded copper wire. The maximum length is 2000 ft.

Install a BT485 terminator on the first and last controller on a network segment to add bias and prevent signal distortions due to echoing. See Fig. A, D, and E.

To wire the UPC Open controller to the BAS network:

1. Pull the screw terminal connector from the controller's BAS Port.

2. Check the communications wiring for shorts and grounds.

3. Connect the communications wiring to the BAS port's screw terminals labeled Net +, Net -, and Shield.

NOTE: Use the same polarity throughout the network segment.

4. Insert the power screw terminal connector into the UPC Open controller's power terminals if they are not currently connected.

5. Verify communication with the network by viewing a module status report. To perform a module status report using the BACview keypad/display unit, press and hold the "FN" key then press the "." key.
Fig. D — Network Wiring
Fig. E — BT485 Terminator Installation

To install a BT485 terminator, push the BT485 terminator on to the BT485 connector located near the BACnet connector.

NOTE: The BT485 terminator has no polarity associated with it.

To order a BT485 terminator, consult Commercial Products i-Vu® Open Control System Master Prices.

MS/TP WIRING RECOMMENDATIONS

Recommendations are shown in Tables C and D. The wire jacket and UL temperature rating specifications list two acceptable alternatives. The Halar[1] specification has a higher temperature rating and a tougher outer jacket than the SmokeGard[2] specification, and it is appropriate for use in applications where the user is concerned about abrasion. The Halar jacket is also less likely to crack in extremely low temperatures.

NOTE: Use the specified type of wire and cable for maximum signal integrity.

---

1. Halar is a egistered trademark of Solvay Plastics.
2. SmokeGard is a trademark of AlphaGary-Mexichem Corp.

Table C — MS/TP Wiring Recommendations

SPECIFICATION	RECOMMENDATION
CABLE	Single twisted pair, low capacitance, CL2P, 22 AWG (7x30), TC foam FEP, plenum rated cable
CONDUCTOR	22 or 24 AWG stranded copper (tin plated)
INSULATION	Foamed FEP 0.015 in. (0.381 mm) wall 0.060 in. (1.524 mm) O.D.
COLOR CODE	Black/White
TWIST LAY	2 in. (50.8 mm) lay on pair 6 twists/foot (20 twists/meter) nominal
SHIELDING	Aluminum/Mylar shield with 24 AWG TC drain wire
JACKET	SmokeGard Jacket (SmokeGard PVC) 0.021 in. (0.5334 mm) wall 0.175 in. (4.445 mm) O.D. Halar Jacket (E-CTFE) 0.010 in. (0.254 mm) wall 0.144 in. (3.6576 mm) O.D.
DC RESISTANCE	15.2 Ohms/1000 feet (50 Ohms/km) nominal
CAPACITANCE	12.5 pF/ft (41 pF/meter) nominal conductor to conductor
CHARACTERISTIC IMPEDANCE	100 Ohms nominal
WEIGHT	12 lb/1000 feet (17.9 kg/km)
UL TEMPERATURE RATING	SmokeGard 167°F (75°C) Halar -40 to 302°F (-40 to 150°C)
VOLTAGE	300 Vac, power limited
LISTING	UL: NEC CL2P, or better

LOCAL ACCESS TO UPC OPEN CONTROLLER

The user can use a BACview[6] handheld keypad display unit or the Virtual BACview software as a local user interface to an Open controller. These items let the user access the controller network information. These are accessory items and do not come with the UPC Open controller.

The BACview[6] unit connects to the local access port on the UPC Open controller. See Fig. F. The BACview software must be running on a laptop computer that is connected to the local access port on the UPC Open controller. The laptop will require an additional USB link cable for connection.

See the *BACview Installation and User Guide* for instructions on connecting and using the BACview[6] device.

To order a BACview[6] Handheld (BV6H), consult Commercial Products i-Vu Open Control System Master Prices.

CONFIGURING THE UPC OPEN CONTROLLER'S PROPERTIES

The UPC Open device and *Comfort*Link controller must be set to the same CCN Address (Element) number and CCN Bus number.

The factory default settings for CCN Element and CCN Bus number are 1 and 0 respectively.

If modifications to the default Element and Bus number are required, both the *Comfort*Link and UPC Open configurations must be changed.

The following configurations are used to set the CCN Address and Bus number in the *Comfort*Link controller. These configurations can be changed using the scrolling marquee display or accessory Navigator handheld device.

    Configuration→CCN→CCN.A (CCN Address)

    Configuration→CCN→CCN.B (CCN Bus Number)

The following configurations are used to set the CCN Address and Bus Number in the UPC Open controller. These configurations can be changed using the accessory BACview[6] display.

    Navigation: BACview→CCN
   Home: Element Comm Stat
    Element: 1
    Bus: 0
Fig. F — BACview[6] Device Connection

If the UPC Open is used with the chiller application of Lead/Lag/Standby, all chillers and UPC Open's CCN element numbers must be changed to a unique number in order to follow CCN specifications. In this application, there can only be a maximum of 3 UPC Open controllers on a CCN bus.

For the CCN Alarm Acknowledger configuration, the UPC Open defaults to CCN Acknowledger. If a Chiller Lead/Lag/Standby application is being used, then the Carrier technician must change the configuration to only one CCN Acknowledger on the CCN bus.

For the CCN Time Broadcaster configuration, the UPC Open defaults to CCN Time Broadcaster. If the Chiller Lead/Lag/Standby application is used, then the Carrier technician must change the configuration to only one CCN Time Broadcaster on the CCN bus.

TROUBLESHOOTING

If there are problems wiring or addressing the UPC Open controller, contact Carrier Technical Support.

COMMUNICATION LEDS

The LEDs indicate if the controller is communicating with the devices on the network. See Tables E and F. The LEDs should reflect communication traffic based on the baud rate set. The higher the baud rate the more solid the LEDs become. See Fig. A for location of LEDs on the UPC Open module.

REPLACING THE UPC OPEN BATTERY

The UPC Open controller's 10-year lithium CR2032 battery provides a minimum of 10,000 hours of data retention during power outages.

IMPORTANT: Power must be **ON** to the UPC Open when replacing the battery, or the date, time, and trend data will be lost.

Remove the battery from the controller, making note of the battery's polarity. Insert the new battery, matching the battery's polarity with the polarity indicated on the UPC Open controller.

NETWORK POINTS LIST

The points list for the controller is shown in Table G.

Refer to Appendix B for additional information on CCN point name.

Table E — LED Status Indicators

LED	STATUS
POWER	Lights when power is being supplied to the controller. The UPC Open controller is protected by internal solid-state polyswitches on the incoming power and network connections. These polyswitches are not replaceable and will reset themselves if the condition that caused the fault returns to normal.
RX	Lights when the controller receives data from the network segment; there is an Rx LED for Ports 1 and 2.
TX	Lights when the controller transmits data to the network segment; there is a Tx LED for Ports 1 and 2.
RUN	Lights based on controller status. See Table F.
ERROR	Lights based on controller status. See Table F.

Table F — Run and Error LEDs Controller and Network Status Indication

RUN LED	ERROR LED	STATUS
2 flashes per second	Off	Normal
2 flashes per second	2 flashes, alternating with **Run** LED	Five minute auto-restart delay after system error
2 flashes per second	3 flashes, then off	Controller has just been formatted
2 flashes per second	1 flash per second	Controller is alone on the network
2 flashes per second	On	Exec halted after frequent system errors or control programs halted
5 flashes per second	On	Exec start-up aborted, Boot is running
5 flashes per second	Off	Firmware transfer in progress, Boot is running
7 flashes per second	7 flashes per second, alternating with **Run** LED	Ten second recovery period after brownout
14 flashes per second	14 flashes per second, alternating with **Run** LED	Brownout

I. Project Information

Job name _____   Installing contractor_____
Address _____   Sales office _____
City _____State_____ Zip _____   Start-up performed by_____

Unit

Model _____   Serial _____

II. Preliminary Equipment Check (To Be Performed By Installing Contractor)

IS THERE ANY PHYSICAL DAMAGE? ☐ YES ☐ NO

IF YES, WAS IT NOTED ON THE FREIGHT BILL, AND HAS A CLAIM BEEN FILED WITH THE SUPPLIER? ☐ YES ☐ NO

DESCRIPTION _____

_____

1. UNIT IS INSTALLED LEVEL AS PER THE INSTALLATION INSTRUCTIONS. ☐ YES ☐ NO

2. POWER SUPPLY AGREES WITH THE UNIT NAMEPLATE. ☐ YES ☐ NO

3. ELECTRICAL POWER WIRING IS INSTALLED PROPERLY. ☐ YES ☐ NO

4. UNIT IS PROPERLY GROUNDED. ☐ YES ☐ NO

5. ELECTRICAL CIRCUIT PROTECTION HAS BEEN SIZED AND INSTALLED PROPERLY. ☐ YES ☐ NO

6. ALL TERMINALS ARE TIGHT. ☐ YES ☐ NO

7. ALL PLUG ASSEMBLIES ARE TIGHT. ☐ YES ☐ NO

8. REMOVE SHIPPING BRACKETS FROM COMPRESSORS. ☐ YES ☐ NO

Chilled Water System Check (to be performed by installing contractor)

1. SYSTEM HAS BEEN PROPERLY CLEANED AND FILLED. ☐ YES ☐ NO

2. ALL CHILLED WATER VALVES ARE OPEN. ☐ YES ☐ NO

II. Preliminary Equipment Check (Cont)

3. ALL PIPING IS CONNECTED PROPERLY. ☐ YES ☐ NO

4. ALL AIR HAS BEEN PURGED FROM THE SYSTEM. ☐ YES ☐ NO

5. CHILLED WATER PUMP IS OPERATING WITH THE CORRECT ROTATION. ☐ YES ☐ NO

6. CHILLED WATER PUMP CONTROLLED BY CHILLER. ☐ YES ☐ NO

7. CHILLED WATER PUMP STARTER INTERLOCKED WITH CHILLER. □ YES □ NO

8. INTEGRATED 40 MESH Y STRAINER CLEAN. □ YES □ NO

9. WATER LOOP VOLUME GREATER THAN MINIMUM REQUIREMENTS. (See Table 30). □ YES □ NO

10. PROPER LOOP FREEZE PROTECTION PROVIDED TO _____ °F (°C). □ YES □ NO
ANTIFREEZE TYPE _____ CONCENTRATION _____%.
IF OUTDOOR AMBIENT IS BELOW 32 F (0° C) THEN ITEMS 11-13 HAVE TO BE
COMPLETED TO PROVIDE COOLER FREEZE PROTECTION TO –20 F (–29 C). (REFER
TO WINTER SHUTDOWN FOR PROPER COOLER WINTERIZATION PROCEDURE.)

NOTE: GLYCOL CONCENTRATIONS ABOVE 30% MAY REQUIRE A FLOW SWITCH RE-CALIBRATION.

11. OUTDOOR PIPING WRAPPED WITH ELECTRIC HEATER TAPE, □ YES □ NO
INSULATED AND OPERATIONAL.

12. COOLER HEATERS INSTALLED AND OPERATIONAL. □ YES □ NO

13. CRANKCASE HEATERS (IF EQUIPPED) ARE SECURELY ATTACHED, OPERATIONAL,
AND ENERGIZED TO REMOVE ANY LIQUID FROM THE COMPRESSOR. □ YES □ NO

SIGNATURE REQUIRED

PRELIMINARY START-UP COMPLETE.

INSTALLING/MECHANICAL CONTRACTOR _____ DATE_____

III. Unit Start-Up (Qualified individuals only. Factory start-up recommended.)

Design Information

CAPACITY	CEAT	EWT	LWT	FLUID TYPE	FLOW RATE	P.D.

1. ALL CABLES AND THERMISTORS HAVE BEEN INSPECTED FOR CROSSED WIRES. □ YES □ NO

2. ALL THERMISTORS ARE FULLY INSERTED INTO WELLS. □ YES □ NO

3. COMPRESSOR OIL LEVEL IS CORRECT. □ YES □ NO

4. VERIFY CRANKCASE HEATERS (IF EQUIPPED) HAVE BEEN ENERGIZED
FOR 24 HOURS. □ YES □ NO

5. VERIFY COMPRESSOR MOUNTING BOLT TORQUE IS 7-10 FT-LB (9.5-13.5 N-M). □ YES □ NO

6. LEAK CHECK UNIT. LOCATE, REPAIR AND REPORT ANY REFRIGERANT LEAKS. □ YES □ NO

7. VOLTAGE IS WITHIN UNIT NAMEPLATE RANGE. □ YES □ NO

8. CONTROL TRANSFORMER PRIMARY CONNECTION SET FOR PROPER VOLTAGE. □ YES □ NO

9. CONTROL TRANSFORMER SECONDARY VOLTAGE = _____

10. CHECK VOLTAGE IMBALANCE: A-B _____   A-C _____   B-C _____

    AVERAGE VOLTAGE = _____ (A-B + A-C + B-C)/3

    MAXIMUM DEVIATION FROM AVERAGE VOLTAGE = _____

    VOLTAGE IMBALANCE = _____% (MAX. DEVIATION/AVERAGE VOLTAGE) X 100

    VOLTAGE IMBALANCE LESS THAN 2%.   ☐ YES ☐ NO

    (DO NOT START CHILLER IF VOLTAGE IMBALANCE IS GREATER THAN 2%.
    CONTACT LOCAL UTILITY FOR ASSISTANCE.)

11. VERIFY COOLER FLOW RATE.   ☐ YES ☐ NO

    PRESSURE ENTERING COOLER   _____ psig (kPa)

    PRESSURE LEAVING COOLER   _____ psig (kPa)

    COOLER PRESSURE DROP   _____ psig (kPa)

    Psig X 2.31 ft/psi =   _____ ft of water

    kPa X 0.334 m/psi   _____ m of water

    COOLER FLOW RATE   _____ gpm (l/s) (See Cooler Pressure
                                    Drop Curves from
                                    Installation Instructions)

12. FLOW SWITCH OPERATION CHECKED.   ☐ YES ☐ NO

Start and Operate Machine. Complete the Following:

1. COMPLETE COMPONENT TEST.   ☐ YES ☐ NO

2. CHECK REFRIGERANT AND OIL CHARGE.   ☐ YES ☐ NO

3. RECORD COMPRESSOR MOTOR CURRENT.   ☐ YES ☐ NO

4. RECORD CONFIGURATION SETTINGS.   ☐ YES ☐ NO

5. RECORD OPERATING TEMPERATURES AND PRESSURES.   ☐ YES ☐ NO

6. PROVIDE OPERATING INSTRUCTIONS TO OWNER'S PERSONNEL.   Instruction Time _____ hours.

OPERATING DATA:

RECORD THE FOLLOWING INFORMATION FROM THE PRESSURES AND TEMPERATURES MODES WHEN MACHINE IS IN A STABLE OPERATING CONDITION:

PRESSURE/TEMPERATURE

	CIRCUIT A	CIRCUIT B
DISCHARGE PRESSURE	DP.A _____	DP.B _____

COMPONENT TEST

USE ESCAPE/ARROW KEYS TO ILLUMINATE CONFIGURATION LED. PRESS ENTER TO DISPLAY "DISP". PRESS ENTER AGAIN TO DISPLAY "TEST" FOLLOWED BY "OFF". PRESS ENTER TO STOP DISPLAY AT "OFF" AND ENTER AGAIN SO "OFF" DISPLAY FLASHES. "PASS" AND "WORD" WILL FLASH IF PASSWORD NEEDS TO BE ENTERED. PRESS ENTER TO DISPLAY PASSWORD FIELD AND USE THE ENTER KEY FOR EACH OF THE FOUR PASSWORD DIGITS. USE ARROW KEYS IF PASSWORD IS OTHER THAN STANDARD. AT FLASHING "OFF" DISPLAY, PRESS THE UP ARROW KEY TO DISPLAY "ON" AND PRESS ENTER. ALL LED SEGMENTS AND MODE LEDS WILL LIGHT UP. PRESS ESCAPE TO STOP THE TEST. PRESS ESCAPE TO RETURN TO THE "DISP" DISPLAY. PRESS THE ESCAPE KEY AGAIN AND USE THE ARROW KEYS TO ILLUMINATE THE SERVICE TEST LED. PRESS ENTER TO DISPLAY "TEST". PRESS ENTER TO STOP DISPLAY AT "OFF" AND ENTER AGAIN SO "OFF" FLASHES. PRESS THE UP ARROW KEY AND ENTER TO ENABLE THE MANUAL MODE. PRESS ESCAPE AND DISPLAY NOW SAYS "TEST" "ON". REFER TO THE TABLE BELOW.
