HIGH EFFICIENCY SINGLE PACKAGE HEAT PUMP UNITS

Model 657A

Sizes 024-060

2 to 5 Tons

DESCRIPTION

Model 657A is our latest generation of high efficiency, packaged heat pumps for manufactured housing, residential, and light commercial applications. The model 657A design is the result of our firm commitment to the development of the finest comfort systems modern technology can offer. Our commitment is backed by our advanced engineering, testing, and research laboratories — and our years of practical experience.

Model 657A is designed in one basic cabinet size and features a side-by-side duct configuration on sizes 024-060.

FEATURES

HIGH EFFICIENCY DESIGN with SEERs (Seasonal Energy Efficiency Ratios) up to 12.0 and HSPFs (Heating Seasonal Performance Factors) of up to 7.2.

FACTORY-ASSEMBLED PACKAGE is a compact, fully self-contained, heat pump unit that is prewired, prepiped, and precharged for minimum installation expense.

657A units are available in a variety of standard sizes with voltage options to meet residential and light commercial requirements. Unit installs easily on a rooftop or a ground-level pad. The optional base rail provides an elevated base.

CONVERTIBLE DUCT CONFIGURATION on the 657A is designed for easy use in either downflow or horizontal discharge applications.

DURABLE, DEPENDABLE COMPRESSORS are designed for high efficiency. Each compressor is hermetically sealed against contamination to help promote longer life and dependable operation. Vibration isolation provides quiet operation. Scroll compressors are standard on all units. Compressors have internal high-pressure and overcurrent protection.

DIRECT-DRIVE MULTISPEED, PSC (permanent split capacitor) BLOWER MOTOR is standard on sizes 024-042 and variable speed (integrated control motor) on sizes 048 and 060.

DIRECT-DRIVE, PSC OUTDOOR-FAN MOTORS are designed to help reduce energy consumption and provide for cooling operation down to 40 F.

REFRIGERANT SYSTEM is designed to provide dependability. Liquid refrigerant strainers are used to promote clean, unrestricted operation. All units feature a proven-reliable reversing valve. Each unit leaves the factory with a full refrigerant charge. Refrigerant service connections make checking operating pressures easier.

INDOOR AND OUTDOOR COILS are computer-designed for optimum heat transfer and cooling efficiency. Outdoor coil is fabricated of copper tube and aluminum fins and is located inside the unit where it is protected against damage for long life and reliable operation.

Copper fin coils are also available by special order. These coils are recommended in applications where aluminum fins are likely to be damaged due to corrosion; for example, seacoast installations.

WEATHERIZED CABINETS are constructed of heavy-duty, phosphated, zinc-coated prepainted steel capable of withstanding 500 hours in salt spray. Interior surfaces of the indoor compartment are insulated with aluminum foil faced insulation to help keep the conditioned air from being affected by the outdoor ambient temperature. Insulation conforms to ASHRAE (American Society of Heating, Refrigeration, and Air Conditioning Engineers) No. 62P. A sloped condensate pan permits an external drain.

LOW SOUND RATINGS ensure a quiet indoor and outdoor environment with sound ratings as low as 7.8 bels.

EASY TO SERVICE CABINETS provide easy accessibility to serviceable components during maintenance and installation. Rounded corners are an important safety feature, and a high-quality finish ensures an attractive appearance.

OPTIONAL BASE RAIL provides holes for rigging and handling as well as an elevated mounting frame that gives additional structural support to horizontal applications.

DOWNFLOW OPTION UNIT is converted for downflow at factory for easy vertical ductwork connections.

FACTORY-INSTALLED OPTIONS DESCRIPTION AND USAGE

Unit With Base Rail — Unit has rigging holes and an elevated mounting frame.

SUGGESTED USE:

- Rigging holes to provide greater ease in handling. Frame to provide greater structural support for horizontal applications.

Downflow Option — Unit is shipped configured for downflow application. Unit is equipped with base rail.

SUGGESTED USE:

- To provide easy vertical ductwork connections.

FIELD-INSTALLED ACCESSORY DESCRIPTION AND USAGE

Flat Roof Curb — Consists of galvanized steel support frame in 8-, 11-, and 14-in. high designs. Provides wood nailer to attach roof counter flashing. Insulated basepans in curbs are provided to prevent condensation. Ductwork attaches to rails provided in the roof curb. A gasket is provided to form an airtight and watertight seal between unit and curb. The roof curb design meets the standards of the NRCA (National Roofing Contractors' Association).

SUGGESTED USE:

- Slab-mounted applications when elevation of the unit above the slab is necessary.
- Rooftop application for downflow discharge.
- Curbs are preassembled and are available for flat or pitched roofs.

Pitched Roof Curb — Provided in ratios of 1, 2, 3, 4, 5, and 6 to 12 for use on pitched roof applications.

SUGGESTED USE:

- For when a roof curb is needed on a pitched roof.

Modulating Economizer — Economizer is available for downflow or horizontal applications, and is designed for easy installation. The economizer reduces energy costs and extends equipment life by allowing the use of outdoor air to supply "free" cooling when conditions are favorable.

Constant ventilation is recommended for light commercial applications when the conditioned space is occupied.

The economizer is shipped complete with a damper motor and linkage, enthalpy control, low-voltage wiring harness, and a rainhood. Adequate wire lengths are provided (additional field-supplied wires are not required). The horizontal economizer is also furnished with a 2-in. disposable air filter and gasket material.

Modulating economizer package consists of low-leakage dampers with controls. The economizer will allow outdoor ventilation air into the unit whenever the indoor fan is running.

SUGGESTED USE:

- Allows outdoor air to be used for "free" cooling whenever the outdoor air is below the enthalpy control setting.
- To reduce energy usage. Use whenever the hours of operation at temperatures below 40 F are significant.

Two-Position Damper — Package consists of a low-leak damper assembly which allows outdoor air into the unit when the indoor fan is energized. When the indoor fan is off, the damper will be closed.

SUGGESTED USE:

- Allows a fixed percentage of outdoor air any time the indoor fan is on. Damper closes when indoor fan is off to prevent cold backdraft and wasted energy.

Manual Outdoor-Air Damper — Package consists of a manually adjustable damper. The package includes a rainhood and birdscreen.

SUGGESTED USE:

- To allow a fixed percentage of outdoor air for ventilation under all conditions.
- The damper may be used on either downflow or horizontal airflow applications.

Thermostat and Subbase — These accessories provide cooling control for unit. Autochangeover and manual changeover types are available.

SUGGESTED USE:

- To operate and control unit, and to maintain desired building temperature.

The 0° F Low Ambient Kit — Kit permits operation down to 0° F in cooling.

SUGGESTED USE:

- When mechanical cooling is required when outdoor-air temperature is between 40 F and 0° F.

Filter Rack — Rack features easy installation and serviceability. The filter rack housing is constructed of heavy-gage steel and is fully insulated. Both sides of the filter rack are flanged for easy installation.

SUGGESTED USE:

- Kit provides ability to locate filters inside the unit.

Rectangular Duct Connection Kit — Kit consists of a sheet metal transition and hardware for mounting.

SUGGESTED USE:

- Allows easy conversion from round to rectangular ducts.

Duct Cover Kit — Kit consists of a panel which covers and seals horizontal duct openings.

SUGGESTED USE:

- To cover horizontal ducts after unit has been converted to downflow discharge.
- Not required with downflow option.

Lifting Bracket Kit — Provides attachment point for rigging straps.

SUGGESTED USE:

- When unit needs to be lifted or moved. The kit is not required when unit is equipped with optional base rail or downflow application.

High- and Low-Pressure Switches — Protect the unit from running at unsuitable pressures.

SUGGESTED USE:

- Provides additional safety features when needed.

Outdoor Thermostat — Accessory provides electric heater control when outdoor-air temperature falls below set point.

SUGGESTED USE:

- To bring second stage of 2-stage electric heat on line.

Electric Heater — Heater module slides into keyed mounting slots in the fan inlet. Heater sizes range from 5.0 to 20.0 kW. Design allows for single-point supply for entire unit.

SUGGESTED USE:

- To provide heating capability when required.

Downshot-to-Sideshot Conversion Kit — Kit consists of downshot (vertical) duct covers, blower mounting bracket, and blower support bracket.

SUGGESTED USE:

- Converts a dedicated downshot discharge unit to a sideshot (horizontal) discharge unit.

SELECTION PROCEDURE

I DETERMINE COOLING AND HEATING REQUIREMENTS AT DESIGN CONDITIONS.

Given:

Required Cooling Capacity (TC)	28,000 Btuh
Sensible Heat Capacity (SHC)	20,500 Btuh
Required Heating Capacity	28,550 Btuh
Outdoor Entering-Air Temperature	95 F
Outdoor-Air Winter Design Temperature	20 F
Indoor-Air Winter Design Temperature	70 F
Indoor Entering-Air Temperature	80 F edb, 67 F ewb
Indoor-Air Quantity	1125 cfm
External Static Pressure	0.40 in. wg
Electrical Characteristics (V-Ph-Hz)	230-1-60
edb — entering dry bulb	
ewb — entering wet bulb	

II SELECT UNIT BASED ON REQUIRED COOLING CAPACITY.

Enter Cooling Capacities table at condenser entering temperature of 95 F, indoor air entering at 1125 cfm and 67 F ewb (entering wet bulb). The 657A030 unit will provide a total cooling capacity of 28,800 Btuh and a sensible heat capacity of 21,900 Btuh.

For indoor-air temperature other than 80 F edb (entering dry bulb), calculate sensible heat capacity correction, as required, using the formula found in Note 3 following the cooling capacities tables.

NOTE: Unit ratings are net capacities.

III SELECT ELECTRIC HEAT.

Enter the unit 657A030 Heating Capacities table at 1125 cfm. At 70 F return indoor air and 20 F air entering outdoor coil, the integrated heating capacity is 15,300 Btuh. (Select integrated heating capacity value since deductions for outdoor-coil frost and defrosting have already been made. No correction is required.)

The required heating capacity is 28,550 Btuh. Therefore, 13,250 Btuh (28,550 – 15,300) additional electric heat is required.

Determine additional electric heat capacity in kW.

$$\frac{13,250 \text{ Btuh}}{3414 \text{ Btuh/kW}} = 3.9 \text{ kW of heat required}$$

Enter the 657A Electric Heater Packages 208/240 V, Single-Phase, Single-Point Wiring Connections table on page 20 for unit 657A030. The 5-kW heater at 240 v most closely satisfies the heating required. To calculate kW at 230 v, multiply the heater kW by multiplication factor 0.92 found in the Wattage Multiplication Factors table on page 22.

$$5 \text{ kW} \times 0.92 = 4.6 \text{ kW}$$
$$4.6 \times 3414 = 15,704 \text{ Btuh}$$

To calculate kW at 208 v, see electric heater packages table on page 20.

Total unit heating capacity is 31,004 Btuh (15,300 + 15,704).

IV DETERMINE FAN SPEED AND POWER REQUIREMENTS AT DESIGN CONDITIONS.

Before entering the air delivery tables, calculate the total static pressure required. From the given, the Accessory Electric Heat Pressure Drop table, Wet Coil Pressure Drop table, and the Filter Pressure Drop table, find:

External static pressure	0.40 in. wg
Filter	0.08 in. wg
Electric heat	0.04 in. wg
Wet coil	0.06 in. wg
Total static pressure	0.58 in. wg

Enter the table for Dry Coil Air Delivery — Horizontal and Vertical Discharge at 1125 cfm and 230-v high speed. By interpolation, the standard motor will deliver 0.66 in. wg static pressure. This will adequately handle job requirements.

**DRY COIL AIR DELIVERY* — HORIZONTAL AND VERTICAL DISCHARGE
(DEDUCT 10% FOR 208 V) — UNITS 024-042**

UNIT SIZE	MOTOR SPEED		230 AND 460 V HORIZONTAL DISCHARGE										
			External Static Pressure (in. wg)

*Air delivery values are based on operating voltage of 230 v or 460 v, dry coil, without filter or electric heater. Deduct wet coil, filter, and electric heater pressure drops to obtain external static pressure available for ducting.

NOTES:

1. Do not operate the unit at a cooling airflow that is less than 350 cfm for each 12,000 Btuh of rated cooling capacity. Indoor coil frosting may occur at airflows below this point.
2. Dashes indicate portions of table that are beyond the blower motor capacity or are not recommended.

**DRY-COIL AIR DELIVERY* — HORIZONTAL AND VERTICAL DISCHARGE
FOR INTEGRATED CONTROL MOTOR UNITS AT 230 V —
UNITS 048 AND 060 (DEDUCT 10% FROM CFM FOR 208-V OPERATION)**

UNIT SIZE	FAN ONLY (Cfm)	COOLING (Cfm)	HEATING (Cfm)
048	1530	1575	1575
060	1750	1800	2000

*Air delivery values are for dry coil at 230 v. Airflow is independent of external static pressure within $\pm 5\%$ of table values up to 0.8 in. wg. Air delivery is preset at factory.

NOTE: Do not operate the unit at a cooling airflow that is less than 350 cfm for each 12,000 Btuh of rated cooling capacity. Indoor coil icing may occur at airflows below this point. Water blow-off may occur at airflows above 450 cfm per 12,000 Btuh of rated cooling capacity.

LEGEND

- FLA** — Full Load Amps
HACR BRKR — Heating, Air Conditioning and Refrigeration Circuit Breaker
MOCP — Maximum Overcurrent Protection (fuses or HACR-type circuit breaker)
NEC — National Electrical Code

*Electric heat capacity (kW) is based on heater voltages of 480 v. If power distribution voltage to units varies from rated heater voltage, see Wattage Multiplication Factors table on page 22.

NOTES:

- In compliance with NEC requirements for multimotor and combination load equipment (refer to NEC Articles 430 and 440), the overcurrent protective device for the unit shall be fuse or HACR breaker.
- This unit must be supplied from a 480 v, 3-phase power supply with a maximum voltage to ground of 300 v.

WATTAGE MULTIPLICATION FACTORS

HEATER VOLTAGE RATING	ACTUAL HEATER VOLTAGE	MULTIPLICATION FACTOR
240	200	0.69
	208	0.75
	220	0.84
	230	0.92
	240	1.00
480	415	0.75
	440	0.84
	460	0.92
	480	1.00

Example: 20.0 kW (at 240 v) heater on 230 v
= 20.0 (0.92 multiplication factor)
= 18.4 kW capacity at 230 v

MINIMUM AIRFLOW (CFM) FOR SAFE ELECTRIC HEATER OPERATION

024	030	036	042	048	060
800	1000	1300	1300	1600	1750

OPERATING SEQUENCE

When power is supplied to unit, the transformer (TRAN) is energized.

Cooling — With the thermostat subbase in the cooling position, and when the space temperature comes within 2° F of the cooling set point, the thermostat makes circuit R-O. This energizes the reversing valve solenoid (RVS) and places the unit in standby condition for cooling.

As the space temperature continues to rise, the second stage of the thermostat makes, closing circuit R-Y. When compressor time delay (5 ± 2 minutes) is completed, a circuit is made to contactor (C), starting the compressor (COMP) and outdoor-fan motor (OFM). Circuit R-G is made at the same time, starting the indoor-fan motor (IFM) after a 1-second delay.

When the thermostat is satisfied, contacts open, deenergizing C. The COMP and OFM stop, and the IFM stops after a short time delay.

Heating — On a call for heat, thermostat makes circuits R-Y and R-G. When compressor time delay (5 ± 2 minutes) is

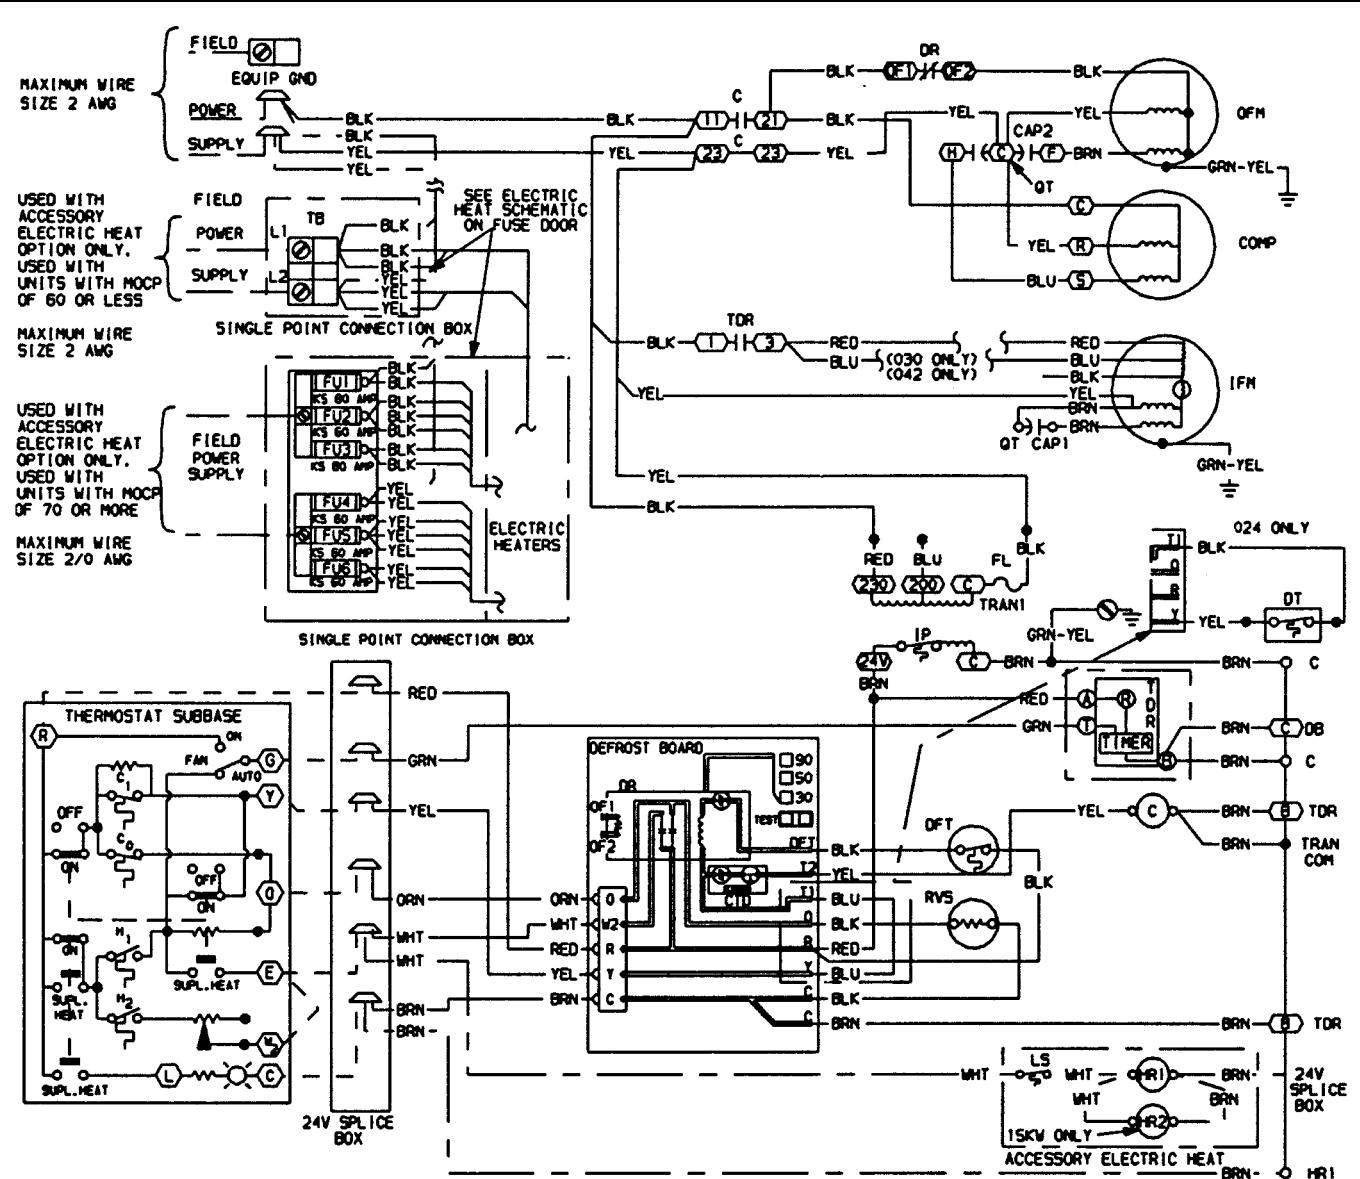

completed, a circuit is made to C, starting COMP and OFM. Circuit R-G also starts IFM after a 1-second delay.

Should room temperature continue to fall, circuit R-W is made through second-stage thermostat bulb. If optional electric heat package is used, a relay is energized, bringing on first bank of supplemental electric heat. When thermostat is satisfied, contacts open, deenergizing contactor and relay; motors and heaters deenergize. The IFM may be controlled by a time-delay relay that keeps the fan on for 30 seconds.

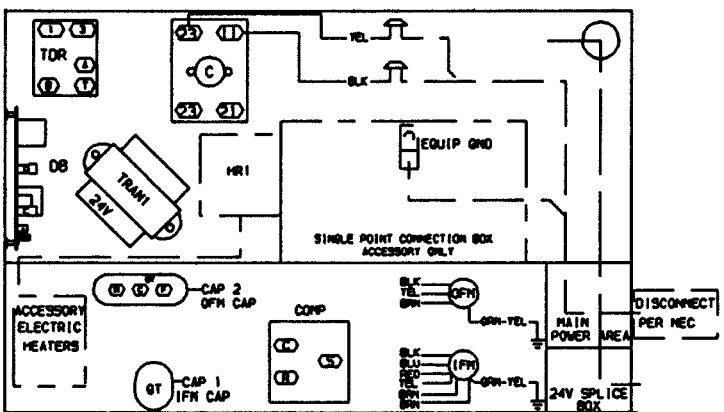

Defrost — Defrost board (DB) is a time and temperature control, which includes a field-selectable time period between checks for defrost (30, 50, and 90 minutes). Electronic timer and defrost cycle start only when contactor is energized and defrost thermostat (DFT) is closed.

Defrost mode is identical to Cooling mode, except OFM stops and a bank of optional electric heat turns on to warm air supplying the conditioned space.

TYPICAL FIELD WIRING (Single Phase, Units 024-042)

COMPONENT ARRANGEMENT

NOTES:

- If any of the original wire furnished must be replaced, it must be replaced with type 90° C wire or its equivalent.
- Thermostat: HH07AT171
Subbase: HH93AZ188
- Set heat anticipator at .26.
- Use copper conductors only.

NOTES:

1. In compliance with NEC requirements for multimotor and combination load equipment (refer to NEC Articles 430 and 440), the overcurrent protective device for the unit shall be fuse or HACR breaker. The CSA units may be fuse or circuit breaker.

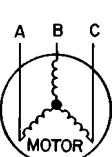

2. Unbalanced 3-Phase Supply Voltage

Never operate a motor where a phase imbalance in supply voltage is greater than 2%. Use the following formula to determine the percent of voltage imbalance.

% Voltage Imbalance

$$= 100 \times \frac{\text{max voltage deviation from average voltage}}{\text{average voltage}}$$

Example: Supply voltage is 460-3-60.

$$\begin{aligned} AB &= 452 \text{ v} \\ BC &= 464 \text{ v} \\ AC &= 455 \text{ v} \end{aligned}$$

$$\begin{aligned} \text{Average Voltage} &= \frac{452 + 464 + 455}{3} \\ &= \frac{1371}{3} \\ &= 457 \end{aligned}$$

Determine maximum deviation from average voltage.

$$(AB) 457 - 452 = 5 \text{ v}$$

$$(BC) 464 - 457 = 7 \text{ v}$$

$$(AC) 457 - 455 = 2 \text{ v}$$

Maximum deviation is 7 v.

Determine percent of voltage imbalance.

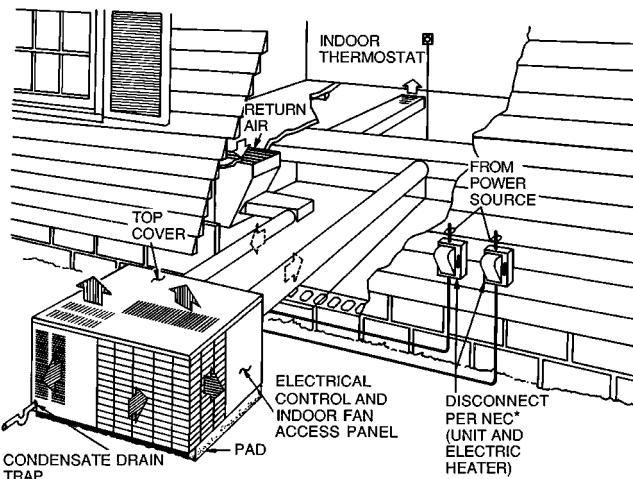

$$\begin{aligned} \% \text{ Voltage Imbalance} &= 100 \times \frac{7}{457} \\ &= 1.53\% \end{aligned}$$

This amount of phase imbalance is satisfactory as it is below the maximum allowable 2%.

IMPORTANT: If the supply voltage phase imbalance is more than 2%, contact your local electric utility company immediately.

TYPICAL INSTALLATION

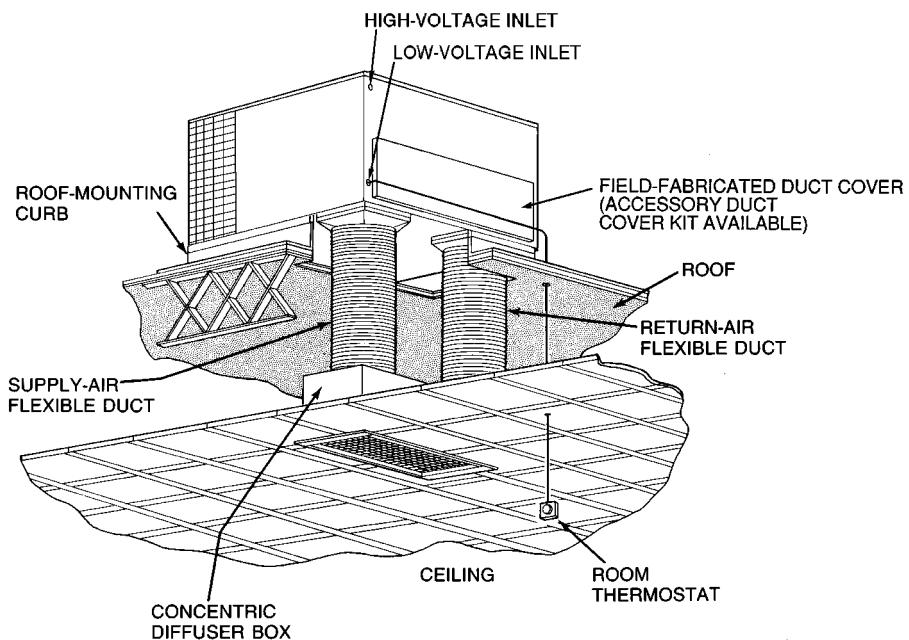

LEGEND

-  Power Wiring
-  Outdoor Airflow
-  Control Wiring
-  Indoor Airflow

*Separate disconnect per NEC (National Electrical Code) is required for electric heater when single-point connection is not used.

ENGINEERS' SPECIFICATION GUIDE

GENERAL: Furnish and install outdoor package, electrically controlled, heat pump utilizing a scroll-type compressor. Unit shall discharge supply air horizontally or vertically as shown on contract drawings.

Nominal unit electrical characteristics shall be _____ v, _____ ph, 60 Hz. The unit shall be capable of satisfactory operation within voltage limits of _____ v to _____ v. Unit power wiring shall enter unit cabinet at a single location. Separate power supply shall not be required for electric heat.

COOLING CAPACITY: Total cooling capacity of the unit shall be _____ Btuh or greater, and sensible capacity shall be _____ Btuh or greater at conditions of _____ cfm indoor air entering unit at _____ F dry bulb, _____ F wet bulb and outdoor entering air of _____ F dry bulb. Total design conditions shall be a minimum of _____ Btuh/Watt. The unit shall be capable of cooling operation down to 40 F as shipped from the factory.

HEATING CAPACITY: Total heating capacity shall be _____ Btuh or greater (integrated rating) when rated at _____ F dry-bulb outdoor ambient with _____ cfm and _____ F entering (heating) coil. The equipment must have a minimum HSPF (Heating Seasonal Performance Factor) of _____. Compressor shall be capable of operation in heating duty down to -20 F ambient outdoor-air temperature. Unit shall be capable of simultaneous heating duty and defrost cycle operation when using accessory electric heaters.

CABINET: Unit cabinet shall be constructed of phosphated, bonderized, zinc-coated, prepainted steel, capable of withstanding 500 hours in salt spray.

Indoor-fan compartment interior cabinet surfaces shall be insulated with a minimum ½-in. thick, flexible fiberglass insulation, coated on the air side with aluminum foil (shall conform to ASHRAE 62P).

Cabinet panels shall be easily removable for servicing.

COMPRESSOR: Compressor shall be fully hermetic type with internal and external vibration isolation.

OUTDOOR SECTION: Outdoor fan shall be of the direct-driven propeller type with aluminum blades, riveted to corrosion-resistant steel spiders, and shall be dynamically balanced and discharge air horizontally or vertically upwards.

Outdoor coils shall have aluminum-plate fins mechanically bonded to seamless copper tubes with all joints brazed.

Tube sheet openings shall be belled to prevent tube wear.

INDOOR SECTION: Fan shall be 3-speed (sizes 024-042) or variable speed (sizes 048,060) with direct drive motor as shown on the equipment drawings.

Fan wheel shall be made from steel, be double-inlet type with forward-curved blades with a corrosion-resistant finish and dynamically balanced.

Indoor coils shall have aluminum-plate fins mechanically bonded to seamless copper tubes with all joints brazed.

Tube sheet openings shall be belled to prevent tube wear.

MOTORS: Compressor motors shall be of the refrigerant-cooled type with line break thermal and current overload protection.

All fan motors shall have permanently lubricated bearings, and inherent automatic reset thermal overload protection.

Outdoor-fan motor shall be totally enclosed.

REFRIGERANT SYSTEM: Refrigerant system shall include fixed orifice metering feed system.

CONTROLS: Unit shall be complete with self-contained low-voltage control circuit.

APPROVALS: Unit shall be UL listed and CSA certified as a total package for safety requirements. All wiring shall be in accordance with NEC.

Unit shall be rated in accordance with ARI Standards 210/240-89 and 270-89. Unit shall be designed in accordance with UL Standard 1995.

Unit shall be designed to conform to ASHRAE 15.

Unit shall be manufactured in a facility registered to ISO 9002. (International Standards Organization) manufacturing quality standard.

Insulation and adhesive shall meet NFPA 90A requirements for flame spread and smoke generation.

Roof curb shall be designed to conform to NRCA standards.

OPTIONS: Factory-installed options shall include base rail and downflow option.

ACCESSORIES: Field-installed accessories shall include outdoor thermostat, thermostat and subbase, electric heaters with single-point connection, modulating economizer, two-position damper, manual outdoor-air damper, filter rack, duct cover kit, lifting bracket kit, rectangular duct connection kit, low- and high-pressure switch kits, roof curbs, low-ambient kit and downshot-to-sideshot conversion kit.
