Fig. 1 – Unit PH5Z

Single-Packaged Heat Pump Units with:

- Easy installation design
- Corrosion-proof unit base
- Class leading sound ratings
- Sloped drain for improved indoor air quality
- Scroll compressors
- Front and side service access
- Louvered panel coil protection
- Aluminum coil
- Cabinet air leakage less than 2.0% at 1.0 in. W.C. and cabinet air leakage less than 1.4% at 0.5 in W.C. when tested in accordance with ASHRAE standard 193
- Refrigerant leak detection dissipation system for added safety

Features/Benefits

This unit is a packaged heat pump for manufactured housing, residential, and light commercial applications. Factory assembled package is a compact, horizontal supply and return unit, combining easy installation and maintenance with efficient performance.

R-454B is the latest choice of refrigerant to help meet the 2025 GWP requirement. This unit is designed and tested with R-454B and contains a dissipation system.

EASY TO INSTALL—The units are lightweight, compact single package units that are easy to handle. Every size unit has an identical 32 by 51-in. (813 by 1295 mm) footprint to make job site planning simple. The efficient design uses less sheet metal and makes this unit lighter than competitive units. The unit can be easily positioned on the job site with the hand-holds built into the unit basepan.

AERODYNAMIC FAN BLADE DESIGN reduces overall sound by up to 3dBA; as low as 70dBA.

SERVICE ACCESS—The units are designed to be serviced from both front and side. Routine maintenance tasks, such as coil cleaning, are sped up with the multiple side panels design.

CORROSION PROOF UNIT BASE—The unit features a tough, high-tech, single-piece composite material unit base with an integrated drain. The composite material eliminates the potential problem of rust and premature replacement which are common with standard metal pans. Each unit base is sloped to eliminate standing water. This feature minimizes the amount of standing water inside the unit, which limits mold and mildew growth.

DURABLE STEEL CABINET—The watertight construction and corrosion-resistant finish will keep it looking like new for years. A specialized paint treatment process ensures quality protection against the elements. A compact, low-profile design utilizes a louvered coil enclosure for maximum protection against hail damage and vandalism.

SCROLL COMPRESSORS—Each unit comes standard with a scroll compressor. Each scroll compressor is hermetically sealed against contamination to help promote longer life and dependable operation. All scroll compressors have internal high-pressure and overcurrent protection.

COIL EFFICIENCY—Indoor and outdoor coils are computer designed for optimum heat transfer and cooling efficiency.

DEFROST SYSTEM—The system provides time/ temperature-based defrost cycles to maintain unit efficiency. This highly reliable system monitors coil temperature and initiates a defrost cycle only if it is required. The defrost cycle ends as soon as defrosting is complete.

ACCESSORY ELECTRIC HEATERS—A variety of accessory electric heaters are available for these units. These heaters are comprised of a separate heater module mounted on the blower inlet and remote mounted controls located in the unit control box. Single point electrical connections are provided for powering both the heater and the unit.

START COLLARS—Start collars are provided with each unit to provide easy connection to the structure ductwork.

DEPENDABLE COMPONENTS—Direct-drive, multi-speed blower motor is standard on all models.

DIRECT-DRIVE, PSC OUTDOOR-FAN MOTORS are designed to help reduce energy consumption and provide for cooling operation down

to 40°F (4.4°C). It's high efficiency design ensures high performance with most duct systems.

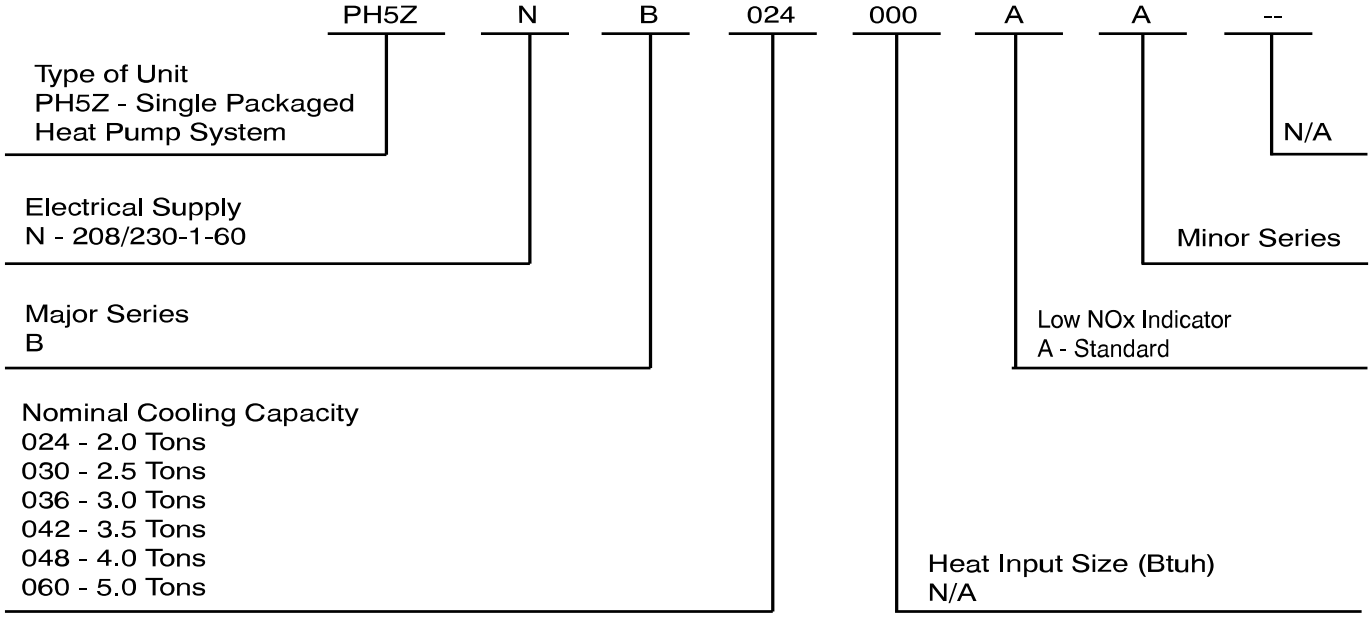

REFRIGERANT SYSTEM is designed to provide dependability. Liquid refrigerant filter driers are used to promote clean, unrestricted operation. Each unit leaves the factory with a non-ozone depleting and low global warming potential R-454B refrigerant charge. Refrigerant service connections make checking operating pressure easier. Factory-installed leak detection dissipation system for added safety.

Selection Procedure

DETERMINE COOLING AND HEATING REQUIREMENTS AT DESIGN CONDITIONS

Given:

Required Cooling Capacity (TC)	28,000
Sensible Heat Capacity (SHC)	20,500 Btuh
Required Heating Capacity	28,550 Btuh
Outdoor Entering-Air Temperature	95°F (35°C)
Outdoor-Air Winter Design Temperature	20°F (-6.7°C)
Indoor-Air Winter Design Temperature	70°F (21.1°C)
Indoor Entering-Air Temperature	80°F (26.7°C) edb, 67°F ewb (19.4°C)
Indoor-Air Quantity	1000 CFM
External Static Pressure	0.20 IN. W.C.
Electrical Characteristics (V-Ph-Hz)	230-1-60

edb — entering dry bulb
ewb — entering wet bulb

SELECT UNIT BASED ON REQUIRED COOLING CAPACITY

Enter Cooling Capacities table at condenser entering temperature of 95°F (35°C), indoor air entering at 1000 CFM and 67°F (19.4°C) ewb (entering wet bulb). The 030 unit will provide a total cooling capacity of 28,600 Btuh and a sensible heat capacity of 21,600 Btuh.

For indoor-air temperature other than 80°F edb (entering dry bulb), calculate sensible heat capacity correction, as required, using the formula found in Note 3 following the cooling capacities tables.

NOTE: Unit ratings are net capacities.

SELECT ELECTRIC HEAT

Enter the 030 Heating Capacities table at 1000 CFM. At 70°F (21.1°C) return indoor air and 20°F (-6.7°C) air entering outdoor coil, the integrated heating capacity is 15,700 Btuh. (Select integrated heating capacity value since deductions for outdoor-coil frost and defrosting have already been made. No correction is required.)

The required heating capacity is 28,550 Btuh. Therefore, 12,850 Btuh (28,550 - 15,700) additional electric heat is required.

Determine additional electric heat capacity in kW.

$$\frac{12{,}850 \text{ Btuh}}{3414 \text{ Btuh/kW}} = 3.76 \text{ kW of heat required}$$

Enter the Accessory Electric Heater Usage table on page 5 for 208/240v. single-phase, 030 unit. The 5-kW heater at 240v most closely satisfies the heating required. To calculate kW at 230v, multiply the heater kW by multiplication factor 0.92 found in the Multiplication Factors table on page 5.

5 kW x 0.92 = 4.6 kW

4.6 x 3414 = 15,704 Btuh

To calculate kW at 208 v, see Multiplication Factors table on page 5.

Total unit heating capacity is 31,404 Btuh (15,700 +15,704).

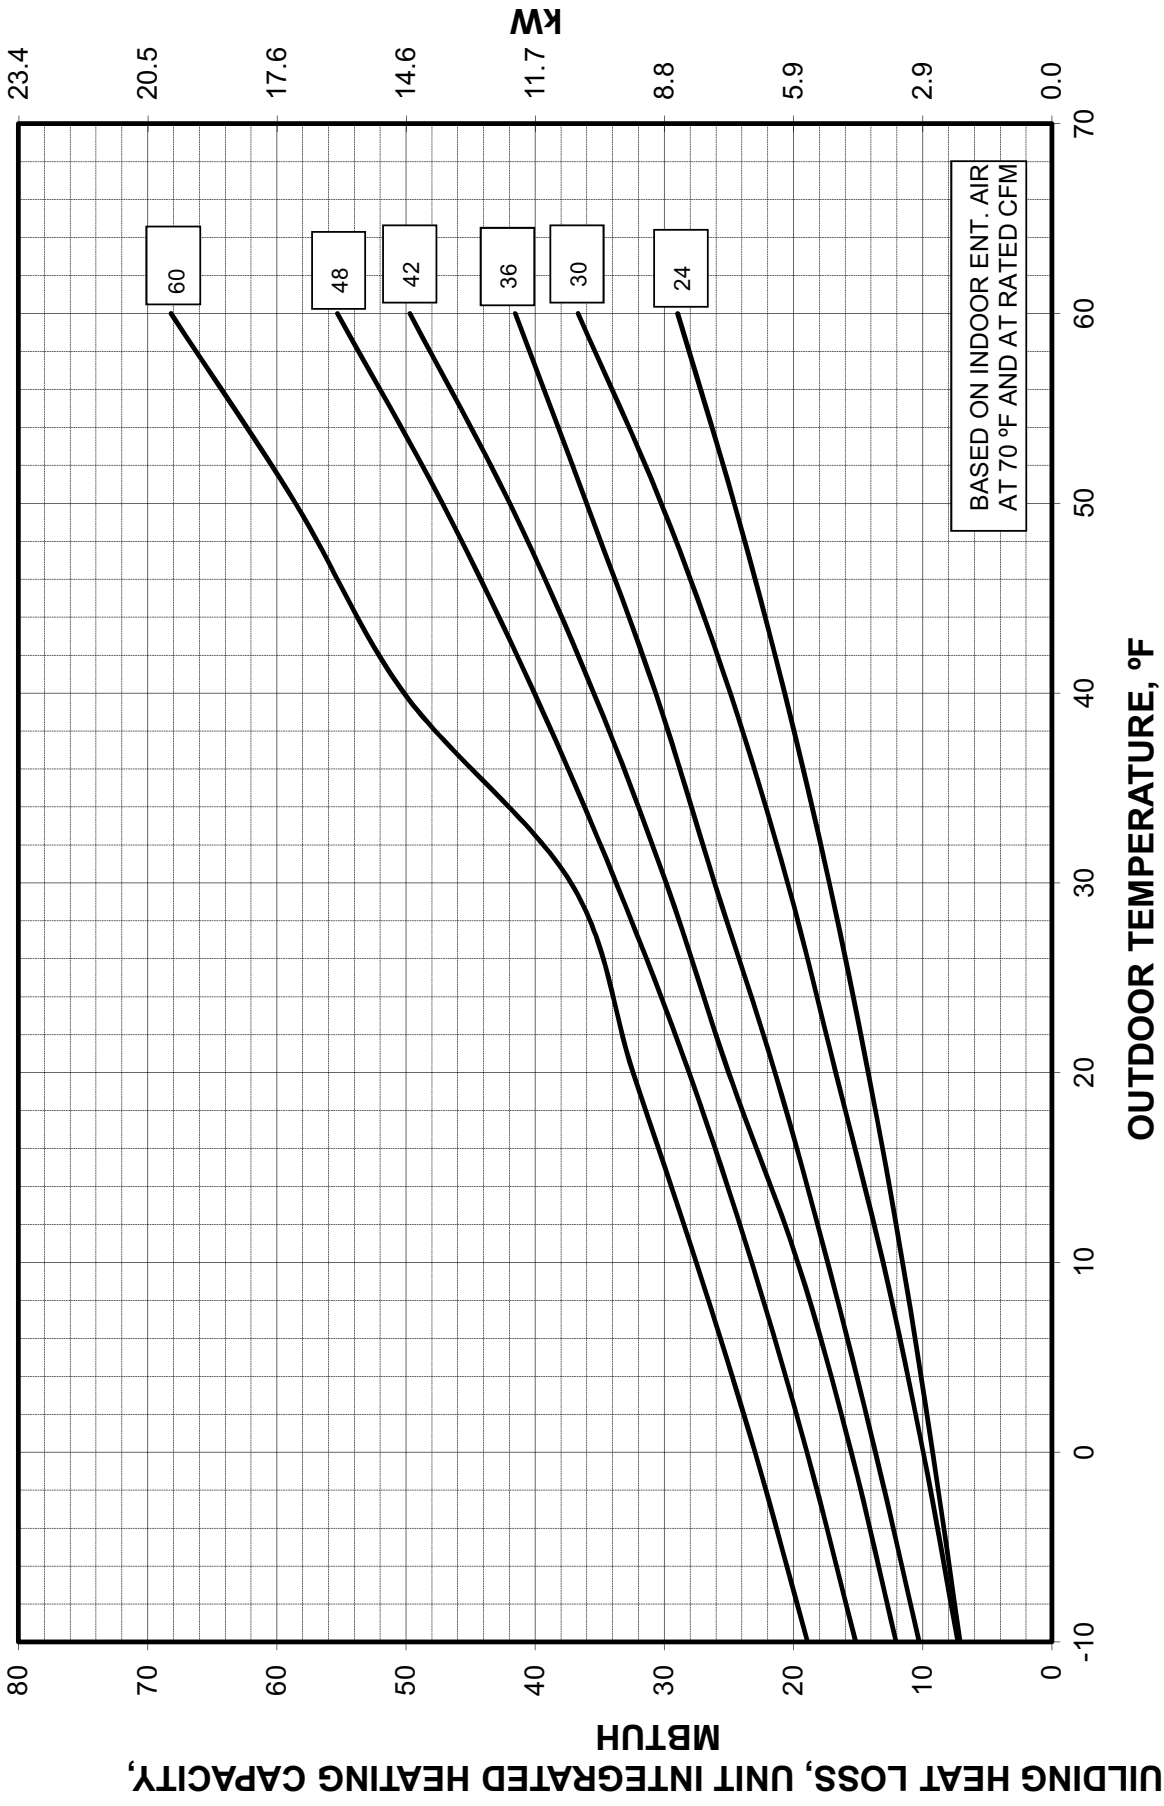

DETERMINE FAN SPEED AND POWER REQUIREMENTS AT DESIGN CONDITIONS

Before entering the air delivery tables, calculate the total static pressure required. From the given, the Accessory Electric Heat Pressure Drop table, and the Filter Pressure Drop table, find:

External static pressure	0.20 IN. W.C.
Filter	0.09 IN. W.C.
Electric heat	0.04 IN. W.C.
Total static pressure	0.33 IN. W.C.

Enter the table for Dry Coil Air Delivery — Horizontal Discharge at 1000 CFM and 230v high speed. The blower will deliver 1085 CFM @ 0.40 IN W.C. static pressure. This will adequately handle job requirements.

Manufacturer reserves the right to change, at any time, specifications and designs without notice and without obligations.

*System kW is total of indoor and outdoor unit kilowatts.
†Sensible capacities shown are based on 80°F (27°C) entering air at the indoor coil. For sensible capacities at other than 80°F (27°C), deduct 835 Btuh (245 kW) per 1000 CFM (480 L/S) of indoor coil air for each degree below 80°F (27°C), or add 835 Btuh (245 kW) per 1000 CFM (480L/S) of indoor coil air per degree above 80°F (27°C).
‡At TVA rating indoor condition (75°F edb/63°F ewb). All other indoor air temperatures are at 80°F (27°C) edb.
LEGEND
BF — Bypass Factor
CFM — Cubic Feet per Minute
edb — Entering Dry Bulb
ewb — Entering Wet-Bulb
^{h}ewb — Enthalpy, entering wet bulb
^{h}lwb — Enthalpy, leaving wet bulb
kW — Total Unit Power Input
SHC — Sensible Heat Capacity (1000 Btuh)
^{t} = Temperature (°F)
^{t}edb — Entering Temperature, Dry Bulb (°F)
^{t}ldb — Leaving Temperature, Dry Bulb (°F)
^{t}lwb — Leaving Temperature, Wet Bulb (°F)
TC — Total Capacity (1000 Btuh) (net)
NOTES:
1. Direct interpolation is permissible. Do not extrapolate.
2. The following formulas may be used:

$$^{t}ldb = {}^{t}edb - \frac{\text{Sensible capacity (Btuh)}}{1.10 \times \text{CFM}}$$

$$^{t}lwb = \text{Wet-bulb temperature corresponding to enthalpy air leaving evaporator coil } (^{h}lwb)$$

$$^{h}lwb = {}^{h}ewb - \frac{\text{total capacity (Btuh)}}{(4.5 \times \text{CFM})}$$

Where: ^{h}ewb = Enthalpy of air entering evaporator coil

The SHC is based on 80°F (26.7°C) edb temperature of air entering indoor coil.
Below 80°F (25.7°C) edb, subtract (corr factor x CFM) from SHC.
Above 80°F (25.7°C) edb, add (corr factor x CFM) from SHC.
Correction Factor = 1.10 x (1 - BF) x (edb - 80)

*. Air delivery values are based on operating voltage of 230v, wet coil, without filter or electric heater. Deduct filter and electric heater pressure drops to obtain static pressure available for ducting.
†. Standard Cubic Feet per Minute
‡. Factory-shipped cooling speed.

NOTES:
1. Do not operate the unit at a cooling airflow that is less than 350 CFM for each 12,000 Btuh of rated cooling capacity. Evaporator coil frosting may occur at airflows below this point.

* kW @ 208/240 - Heater capacity (kW) based on heater voltage of 208v & 240v. If power distribution voltage to unit varies from rated heater voltage, heater kW will vary accordingly.

† HACR Type Circuit Breaker

LEGEND
FLA - Full Load Amps
LRA - Locked Rotor Amps
MCA - Minimum Circuit Amps
MOCP - Maximum Overcurrent Protection
RLA - Rated Load Amps
NOTES:

1. In compliance with NEC (National Electrical Code) requirements for multimotor and combination load equipment (refer to NEC Articles 430 and 440), the overcurrent protective device for the unit shall be Power Supply fuse or circuit breaker.
2. Minimum wire size is based on 60_C copper wire. If other than 60_C wire is used, or if length exceeds wire length in table, determine size from NEC.

Accessory Electric Heater Wiring

Controls

Sequence of operation

When power is supplied to unit, the transformer (TRAN) is energized.

Cooling Operation — With a call for cooling (O,Y,G), the reversing valve, contactor, and indoor fan are energized. When the cooling demand is met, Y and G are de-energized, shutting off the contactor (compressor, outdoor fan). The indoor fan stops after a 60 second delay.

Heating Operation — With a call for heating (Y,G), the contactor and indoor fan are energized. When the heating demand is met, Y and G are de-energized, shutting off the contactor (compressor, outdoor fan). The indoor fan stops after a 60 second delay.

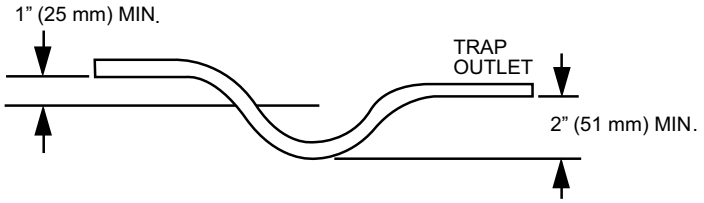

Continuous Fan — With the continuous indoor fan option selected on the thermostat, G is continuously energized keeping the indoor fan running at all times.

Demand Defrost Mode— The defrost mode is factory set to an initial 60-minute time interval. It may also be adjusted to an initial interval of 30, 90, or 120 minutes. During operation, the control optimizes current defrost time based on the previous defrost interval and previous defrost period. If the previous defrost period is less than 2 minutes for two consecutive defrost cycles the control will lengthen the defrost interval by 15 minutes, up to a maximum of 120 minutes or 30 minutes greater than the original setpoint, whichever comes first. If the previous defrost period is more than 5 minutes for two consecutive defrost cycles the control will shorten the defrost interval by 15 minutes, down to a minimum of 30 minutes or 30 minutes from the original setpoint, whichever is first.

After the defrost condition is satisfied, or after a maximum of 10 minutes in defrost mode, the unit will resume normal heating operation.

Application Data

Condensate trap — A 2-in. (51 mm) condensate trap must be field supplied.

A08001

Maximum cooling airflow — To minimize the possibility of condensate blow-off from the evaporator, airflow through the units should not exceed 450 CFM/ton.

Minimum cooling airflow — The minimum cooling airflow is 350 CFM/ton.

Minimum cooling operating outdoor air temperature — All standard units have a minimum ambient operating temperature of 40°F (4.4°C). With accessory low ambient temperature kit, units can operate at temperatures down to 0°F (-17.8°C).

Maximum operating outdoor air temperature — Maximum outdoor operating air temperature for cooling is 125°F (51.7°C).

Guide Specifications

SMALL PACKAGED PRODUCT AIR-TO-AIR HEAT PUMP CONSTANT VOLUME APPLICATION

SIZE RANGE:2 TO 5 TONS, NOMINAL (COOLING)

General

SYSTEM DESCRIPTION

Outdoor packaged, electrically controlled, air-to-air heat pump utilizing a scroll compressor for heating and cooling duty. Unit shall discharge supply air horizontally as shown on contract drawings.

QUALITY ASSURANCE

- Unit shall be rated in accordance with AHRI Standards 210/240, and 270.
- Unit shall be designed to conform to ASHRAE 15.
- Unit will be constructed in accordance with UL standards and will carry the UL label of approval. Unit will have C-UL approval.
- Insulation and adhesive shall meet NFPA 90A requirements for flame spread and smoke generation.

DELIVERY, STORAGE, AND HANDLING

- Unit shall be stored and handled per manufacturer's recommendations.

Products

EQUIPMENT

General:

Factory-assembled, single piece, air-to-air heat pump. Contained within the unit enclosure shall be all factory wiring, piping, controls, and refrigerant charge (R-454B).

Unit Cabinet:

- Unit cabinet shall be constructed of phosphated, bonderized, zinc-coated, prepainted steel.
- Basepan shall be made of a single-piece non-corrosive, composite material.
- Indoor fan compartment cabinet surfaces shall be insulated with a minimum 1/2 in. (12.7 mm) thick, flexible insulation, coated on the air side, with aluminum foil-faced insulation.
- Cabinet panels shall be easily removable for servicing.
- Unit shall have a factory-installed, sloped, noncorrosive, condensate drain.
- Unit insulation conforms to ASHRAE 62P.

Fans:

Indoor Blower (Indoor Fan):

- Fan shall be multispeed, direct drive as shown on the equipment drawings.
- Fan wheel shall be made from steel, be double-inlet type. It shall have forward-curved blades with a corrosion-resistant finish and shall be dynamically balanced.

Outdoor fan shall be of the direct-driven propeller type with aluminum blades, riveted to corrosion-resistant steel spiders. It shall be dynamically balanced, and shall discharge air upwards.

Compressor:

- Fully-hermetic scroll type with external vibration isolation.

Coils:

- Indoor coils shall have aluminum-plate fins mechanically bonded to seamless aluminum tubes with all joints brazed. Outdoor coils shall have copper tubes.
- Tube sheet openings shall be bellied to prevent tube wear.
- Outdoor coil shall be protected by metal louvered panels.

Refrigerant Components:

- TXV and AccuRater feed system.
- Service gauge connections on suction and discharge lines.
- Equipped with liquid line filter drier.
- Equipped with accumulators on all sizes.

Controls and Safeties:

Unit Controls:

- Unit shall be complete with self-contained low voltage control circuit.
- Unit shall incorporate an outdoor coil defrost system to prevent excessive frost accumulation during heating cycle and shall be controlled as follows:
  a. Defrost shall be initiated on the basis of time and coil temperature.
  a. A 30/60/90/120-minute timer shall activate defrost cycle only if coil temperature is low enough to indicate a heavy frost condition.
  b. Defrost cycle shall terminate when defrost thermostat is satisfied or shall have a positive termination time of 10 minutes.

Safeties:

- High Pressure Switch
- Loss of Charge Switch

Operating Characteristics:

- Unit shall be capable of starting and running at 125°F (51.7°C) ambient outdoor temperature (60 size max ambient is 115°F [46.1°C]).
- Compressor with standard controls shall be capable of operation down to 40°F (4.4°C) ambient outdoor temperature in cooling duty.
- Compressor shall be capable of operation in heating cycle down to -20°F (-28.9°C) ambient outdoor-air temperature.
- Unit shall be capable of simultaneous heating duty and defrost cycle operation when using electric heaters indiccated in Section L, Special Features.

Electrical Requirements:

All unit power wiring shall enter unit cabinet at a single location.

Motors:

- Compressor motors shall be of the refrigerant-cooled type with line break thermal and current overload protection.
- All fan motors shall have permanently lubricated bearings and inherent automatic-reset thermal overload protection.
- Outdoor-fan motor shall be totally enclosed.

Grille

- Louvered Grille:
  Louvered grille shall be standard on all units.

Special Features Available

- Thermostat:
  To provide for two-stage heating and one-stage cooling in addition to manual or automatic changeover and indoor fan control.
- Low-Ambient Package:
  Shall consist of a solid-state control and outdoor coil temperature sensor for controlling outdoor fan motor operation, which shall allow unit to operate down to 0°F (-17.8°C) outdoor ambient temperature in cooling.
- Crankcase Heater:
  Shall provide anti-floodback protection for low-load cooling applications.
- Electric heaters:
  Electric heater shall be available as a field-installed option.
  Heater elements shall be open wire type, adequately supported and insulated with ceramic bushings.
  Electric heater packages must provide single point power connection capability.
- Compressor Start Kit:
  Shall be available to give a boost to the compressor motor at each start-up.
- Outdoor Thermostat Kit:
  Thermostat allows for staging of electric heaters based on outdoor air temperature.
