INSTALLATION INSTRUCTIONS
High–Pressure Switch Kit
NASA204PS, NASA404PS

Safety Labeling and Signal Words

DANGER, WARNING, CAUTION, and NOTE

The signal words DANGER, WARNING, CAUTION, and NOTE are used to identify levels of hazard seriousness. The signal word DANGER is only used on product labels to signify an immediate hazard. The signal words WARNING, CAUTION, and NOTE will be used on product labels and throughout this manual and other manuals that may apply to the product.

DANGER – Immediate hazards which will result in severe personal injury or death.

WARNING – Hazards or unsafe practices which could result in severe personal injury or death.

CAUTION – Hazards or unsafe practices which may result in minor personal injury or product or property damage.

NOTE – Used to highlight suggestions which will result in enhanced installation, reliability, or operation.

Signal Words in Manuals

The signal word WARNING is used throughout this manual in the following manner:

⚠️ WARNING

The signal word CAUTION is used throughout this manual in the following manner:

⚠️ CAUTION

Signal Words on Product Labeling

Signal words are used in combination with colors and/or pictures on product labels.

Recognize safety information. This is the safety–alert symbol ⚠️. When you see this symbol on the unit and in instructions or manuals, be alert to the potential for personal injury. Understand these signal words; DANGER, WARNING, and CAUTION. These words are used with the safety–alert symbol. DANGER identifies the most serious hazards which will result in severe personal injury or death. WARNING signifies hazards which could result in personal injury or death. CAUTION is used to identify unsafe practices which may result in minor personal injury or product and property damage. NOTE is used to highlight suggestions which will result in enhanced installation, reliability, or operation. Follow all safety codes. Wear safety glasses and work gloves.

Warning

ELECTRICAL SHOCK HAZARD

Failure to turn off electric power could result in personal injury or death.

Before installing or servicing system, turn off main power to the system. There may be more than one disconnect switch, including accessory heater(s).

NOTE: Read the entire instruction manual before starting the installation.

SAFETY CONSIDERATIONS

Installing and servicing air conditioning equipment can be hazardous due to system pressures and electrical components. Only trained personnel should install or service air conditioning equipment.

Untrained personnel can perform basic maintenance functions such as cleaning coils, or cleaning and replacing filters. All other operations should be performed by trained service personnel. When working on air conditioning equipment, observe precautions in the literature, on tags, and on labels attached to the unit.

WARNING

ELECTRICAL SHOCK HAZARD

Failure to follow this warning could result in personal injury or death.

Before beginning any installation or modification, be sure the main electrical disconnect switch is in the OFF position. TAG THE DISCONNECT SWITCH WITH A SUITABLE WARNING LABEL.

Use only the kit components described in this installation procedure.
INTRODUCTION

WARNING

PERSONAL INJURY AND/OR PROPERTY DAMAGE HAZARD

Failure to follow this warning could result in personal injury, death and/or property damage.

High–Pressure Switch Kit NASA204PS must be installed when heat pump is used with a gas furnace (dual fuel) application.

These instructions cover installation of High–Pressure Switch Kit NASA204PS on split system air conditioners and heat pumps containing R-22 refrigerant and NASA404PS on air conditioners containing R-410A refrigerant.

Kit contents:
- High–Pressure Switch – 1
- Adapter Tee – 1
- Pressure Switch Adapter Tube (AC) – 1
- Pressure Switch Adapter (HP) – 1
- DD24FA051 Flare Gaskets – 2
- Installation Instructions – 1

INSTALLATION

CAUTION

EQUIPMENT DAMAGE AND/OR OPERATION HAZARD

Failure to follow this caution may result in equipment damage or improper operation.

When making flare connections, use one of the flare gaskets provided in the kit to ensure a leak–tight refrigerant connection. Use a backup wrench to avoid breaking connection or splitting flare.

NOTE: The liquid– and vapor–service valves are located outside of the unit at the rear. The smaller valve is the liquid–service valve; the larger valve is the vapor–service valve.

STEP 1 — HIGH–PRESSURE SWITCH INSTALLATION (FOR AIR CONDITIONERS)

Refer to Fig. 1 and proceed as follows to install the high–pressure switch.

NOTE: Make sure the liquid–service valve is in the fully back seated (counterclockwise) position before installation (Back seating service valves have no valve core in the service port).

NOTE: When installing both high– and low–pressure switches on liquid– service valve, connect second tee to service fitting of first tee.

1. For vertical discharge units, remove knockout in service panel next to service valves. For horizontal discharge units, either drill a hole in the service valve plate or route switch through existing service valve holes.
2. Securely connect pressure switch adapter tube flare nut to side of adapter tee without valve core.
3. Route the adapter tube completely through the knockout (vertical discharge units) or service valve hole (horizontal discharge units) so that tee can be attached to liquid service valve later.
4. Securely connect pressure switch flare nut to male flare fitting on adapter tube inside the unit. Using backup wrench, torque to 140 in. lb.
5. Remove seal cap from service fitting on liquid–service valve and securely connect to remaining male flare fitting on adapter tee.
6. Securely connect flare nut on adapter tee to service fitting on liquid–service valve.
7. On back seating valves, remove liquid–service valve stem cap and open valve 3/4 turn.
8. Replace liquid–service valve stem cap fingertight and further tighten cap 1/12 turn.
9. Check all refrigerant connections for leaks and repair if necessary.

NOTE: When installing the pressure switch adapter to a previously installed unit, the unit must be pumped down and the field–installed liquid line disconnected. Refer to Pump–down Procedure in the Split System Residential Air Conditioning and Heat Pump Service Manual.

STEP 2 — HIGH–PRESSURE SWITCH INSTALLATION (FOR HEAT PUMPS)

Refer to Fig. 2 and proceed as follows to install the high–pressure switch.

NOTE: When installing the pressure switch adapter to a previously installed unit, the unit must be pumped down and the field–installed liquid line disconnected. Refer to Pump–down Procedure in the Split System Residential Air Conditioning and Heat Pump Service Manual.

1. Place the warning label on the service panel above the service valves.
2. For vertical discharge units, remove knockout in service panel next to liquid service valve. For horizontal discharge units, either drill a hole in the service valve plate or route switch through existing service valve holes.
3. Route flare fitting end of the pressure switch adapter tube through the knockout hole (vertical discharge) or service valve hole (horizontal discharge).
4. Securely connect pressure switch flare nut to male flare fitting on the pressure switch adapter tube inside unit. Using backup wrench, torque to 140 in. lb.
5. Remove sweat adapter from field liquid line fitting on previously installed unit, the unit must be pumped down and the field–installed liquid line disconnected. Refer to Pump–down Procedure in the Split System Residential Air Conditioning and Heat Pump Service Manual.
6. Braze interconnecting liquid line to belled end of pressure switch adaptor.

**CAUTION**

**EQUIPMENT DAMAGE HAZARD**
Failure to follow this caution may result in equipment damage or improper operation.

To prevent melting of the 1/4-in. OD tube joint, place a wet cloth at the joint area.

7. Check all refrigerant connectors for leaks and repair if necessary.
8. Evacuate indoor coil and refrigerant lines.
9. Open service valves and let charge back into system.
10. Make pressure switch electrical connection per Step 3.

---

**Fig. 2 — High-Pressure Switch Adapter Connections**

**STEP 3 — ELECTRICAL CONNECTION**

See Fig. 3 for Air Conditioner and Fig. 4 and Fig. 5 for Heat Pump.

1. Locate unit contactor coil terminals or, if equipped, compressor time delay terminal T1.
2. On units without compressor time delay, make electrical connections as follows:
   a. One pressure switch in unit: Disconnect Y lead from contactor coil terminal. Connect 1 pressure switch lead to Y lead. Connect other pressure switch lead to contactor coil terminal.
   b. Both high- and low-pressure switches in unit: Disconnect Y lead from contactor coil terminal. Connect 1 high pressure switch lead to Y lead, then connect other high-pressure lead to 1 low-pressure lead. Connect remaining low-pressure lead to contactor coil terminal.
   c. With a factory installed low-pressure switch: Disconnect the low-pressure switch lead from Y connection on control board. Connect 1 high-pressure switch lead to Y, then connect other high-pressure lead to the disconnected low-pressure lead.
3. On units with compressor time delay, make electrical connections as follows:
   a. One pressure switch in unit: Disconnect wire leading to T1 on time delay board. Connect 1 pressure switch lead to disconnected lead. Connect other pressure switch lead to T1 on time delay board.
   b. Both high- and low-pressure switches in unit: Disconnect wire leading to T1 on time delay board. Connect 1 high-pressure switch lead to disconnected lead, then connect other high-pressure lead to 1 low-pressure lead. Connect remaining low-pressure lead to T1 on time delay board.
   c. With a factory installed low-pressure switch: Disconnect the low-pressure switch lead from T1 on time delay board. Connect 1 high-pressure switch lead to T1, then connect other high-pressure lead to the disconnected low-pressure lead.
4. Restore power and check unit operation.
